Microsoft 365 Security Foundations

1.1

Analyze the Zero Trust Security Model

Abbreviation	Full Form
PIM	Privileged Identity Management
BYOD	Bring-your-own-device
DLP	Data Loss Prevention
NIST	National Institute of Standards and Technology
ISO	International Organization for Standardization

1. In Microsoft 365, the Zero Trust model is best described as:

   a. A single product

   b. A comprehensive strategy that spans identity, endpoints, data, applications, infrastructure, and networks

   c. A replacement for all compliance programs

   d. A feature available only in Microsoft Defender for Endpoint

   Answer: b. A comprehensive strategy that spans identity, endpoints, data, applications, infrastructure, and networks.

   Explanation: The model isn't a single product but a comprehensive strategy across six domains.

2. Which native Microsoft tools are specifically named as part of implementing Zero Trust in Microsoft 365? **(Select all that apply)**

   a. Microsoft Entra ID

   b. Microsoft Defender

   c. Intune

   d. Purview

   e. Windows Server Update Services

   Answer: a, b, c, d.

   Explanation: Implementing Zero Trust requires a layered approach combining native tools like Microsoft Entra ID, Microsoft Defender, Intune, and Purview.

3. Why are organizations having a Zero Trust conversation? **(Select all that apply)**

   a. IT security is complex

   b. Trusted network security strategy, accepted lower security within the network

   c. Assets increasingly leave the network

   d. Attackers shift to identity attacks

   e. Passwords are no longer used anywhere

   Answer: a, b, c, d.

   Explanation: These four reasons in the Zero Trust conversation diagram.

4. The three core principles of the Zero Trust security model are Verify explicitly, Least privilege access, and Assume breach. **(True/False)**

   Answer: True.

   Explanation: These are the three principles introduced in the documentation under Core Principles of Zero Trust.

5. Which principle is described as the cornerstone of the Zero Trust model?

   a. Least privilege access
   b. Assume breach
   c. Verify explicitly
   d. Endpoint compliance

   Answer: c. Verify explicitly.

   Explanation: The Verify explicitly principle is the cornerstone of the Zero Trust model.

6. Verify explicitly requires that every access request is authenticated and authorized using all available contextual signals. **(True/False)**

   Answer: True.

   Explanation: Every request from a user, device, or application must be evaluated using contextual signals.

7. Which all are contextual signals? **(Select all that apply)**

   a. Identity attributes
   b. Device health
   c. Location
   d. User behavior
   e. Risk level

   Answer: a, b, c, d, e.

   Explanation: All five are explicitly listed as contextual signals under Verify explicitly.

8. Microsoft 365 enforces Verify explicitly through which combination of mechanisms? **(Select all that apply)**

   a. Conditional Access policies
   b. Real-time risk evaluation
   c. Multifactor authentication
   d. Static credentials only

   Answer: a, b, c.

   Explanation: These mechanisms work together to make access decisions dynamic and based on current context rather than static credentials.

9. Conditional Access in Microsoft Entra ID enables administrators to define:

   a. Granular access rules based on multiple signals
   b. Only password reset workflows
   c. Only firewall rules
   d. Data labeling templates

   Answer: a. Granular access rules based on multiple signals.

   Explanation: Conditional Access evaluates user identity, device compliance, location, application sensitivity, and real-time risk before granting access.

10. Which scenario is a Conditional Access example?

a. Require MFA for users accessing SharePoint Online from outside the corporate network
b. Allow all personal devices to download sensitive documents
c. Disable compliance requirements for contractors
d. Remove access controls for trusted locations permanently

Answer: a. Require MFA for users accessing SharePoint Online from outside the corporate network.

Explanation: This is one of the exact examples given in the Conditional Access section.

11. Conditional Access also supports which session controls? **(Select all that apply)**

    a. Limiting access to read-only mode
    b. Preventing downloads
    c. Enforcing data watermarking in every app
    d. Blocking all sign-ins from corporate devices

    Answer: a, b.

12. Policies can be combined using logical operators to create complex rules that reflect organizational requirements. **(True/False)**

    Answer: True.

    Explanation: Logical operators can combine multiple conditions such as device compliance, trusted location, and low risk score.

13. Secure Score integrates with Conditional Access to do what?

    a. Highlight gaps and suggest improvements
    b. Replace Identity Protection
    c. Create DLP labels automatically
    d. Disable policy simulations

    Answer: a. Highlight gaps and suggest improvements.

    Explanation: Secure Score helps organizations implement Conditional Access effectively by surfacing gaps and recommendations.

14. Administrators can simulate policy impact before deployment to avoid unintended disruptions. **(True/False)**

    Answer: True.

15. Microsoft Entra Identity Protection evaluates sign-in risk using:

    a. Machine learning and global threat intelligence
    b. Hardware inventory only
    c. Local group policy only
    d. Bandwidth monitoring only

    Answer: a. Machine learning and global threat intelligence.

16. Which anomalies are specifically named under risk-based authentication? **(Select all that apply)**

    a. Impossible travel
    b. Unfamiliar sign-in properties
    c. Known compromised credentials
    d. Missing document labels

    Answer: a, b, c.

17. Based on risk level, access can be:

a. Blocked
b. Challenged with MFA
c. Allowed with restrictions
d. All of the above

Answer: d. All of the above.

Explanation: access can be blocked, challenged with MFA, or allowed with restrictions depending on the risk level.

18. Which all are MFA methods or passwordless options? **(Select all that apply)**

    a. Mobile app notification
    b. Biometric scan
    c. Hardware token
    d. Windows Hello
    e. FIDO2 keys

    Answer: a, b, c, d, e.

    Explanation: All five are named in the documentation as supported verification methods or passwordless options.

    Explanation: a sign-in from a known device and location might not trigger MFA, while a new device in a high-risk location can require it.

19. Which capabilities support least privilege in Microsoft 365? **(Select all that apply)**

    a. RBAC
    b. PIM
    c. Defender for Cloud Apps only
    d. Azure Firewall only

    Answer: a, b.

    Explanation: RBAC provides predefined permission roles, and PIM adds just-in-time access to sensitive functions.

20. Which example is used to explain RBAC?

    a. A helpdesk technician granted the Password Administrator role
    b. A contractor granted Global Administrator permanently
    c. A guest user granted mailbox access for all employees
    d. A mobile phone granted domain admin rights

    Answer: a. A helpdesk technician granted the Password Administrator role.

    Explanation: Password Administrator as an example of a narrowly defined role that avoids privilege creep.

21. Match each control or product with its described purpose.

Column A	**Column B**
1. RBAC	a. Aggregates logs and correlates events across domains
2. PIM	b. Provides just-in-time access to sensitive functions
3. Microsoft Sentinel	c. Defines roles with specific permissions
4. Microsoft Purview Information Protection	d. Classifies, labels, and encrypts sensitive data

Answer: 1-c, 2-b, 3-a, 4-d.

22. In PIM, a global administrator can request temporary elevation for a specific task, such as configuring a new Conditional Access policy. **(True/False)**

    Answer: True.

    Explanation: Automatic revocation is one of the reasons PIM reduces the risk of persistent high-level access.

23. The Assume breach principle reflects a shift in mindset from prevention to containment. **(True/False)**

    Answer: True.

    Explanation: Assume breach operates under the assumption that attackers are already inside or might eventually get in.

24. What does the Assume breach principle emphasize? **(Select all that apply)**

    a. Segmentation
    b. Continuous monitoring
    c. Rapid response
    d. Permanent trust for internal systems

    Answer: a, b, c.

    Explanation: These three actions are explicitly named as the focus areas for minimizing breach impact.

25. Which tools are specifically named under the Assume breach principle? **(Select all that apply)**

    a. Microsoft Defender for Endpoint
    b. Microsoft Sentinel
    c. Microsoft Defender for Identity
    d. Azure Policy

    Answer: a, b, c.

    Explanation: These are the three security tools listed as providing visibility across endpoints, identities, and network traffic.

26. Microsoft Defender for Endpoint uses behavioral analytics to detect which anomalies? **(Select all that apply)**

    a. Lateral movement
    b. Privilege escalation
    c. Ransomware activity
    d. SharePoint site creation

    Answer: a, b, c.

    Explanation: These are the exact behaviors named in the Defender for Endpoint section.

27. If a device exhibits suspicious behavior, Microsoft Defender for Endpoint can automatically isolate it from the network. **(True/False)**

    Answer: True.

    Explanation: isolation helps prevent further spread of suspicious activity.

28. What is Microsoft Sentinel described as doing?

    a. Aggregating logs and alerts from across Microsoft 365 and non-Microsoft sources
    b. Managing only local firewalls
    c. Enforcing app protection policies on mobile phones
    d. Replacing Conditional Access

    Answer: a. Aggregating logs and alerts from across Microsoft 365 and non-Microsoft sources.

    Explanation: Sentinel uses machine learning to correlate events and identify threats spanning multiple domains.

29. Which scenario is used to explain Microsoft Sentinel correlation?

    a. A phishing email detected by Defender for Office 365 linked to a compromised account in Microsoft Entra ID and a malicious file in SharePoint
    b. A printer jam linked to a failed password reset
    c. A Teams status message linked to a VM resize request
    d. A DLP label linked to a device wallpaper change

    Answer: a. A phishing email detected by Defender for Office 365 linked to a compromised account in Microsoft Entra ID and a malicious file in SharePoint.

    Explanation: This is the exact cross-domain example used to describe Sentinel's correlation capabilities.

30. Which techniques can Microsoft Defender for Identity detect? **(Select all that apply)**

    a. Pass-the-Hash
    b. Golden Ticket attacks
    c. Domain enumeration
    d. Browser theme changes

    Answer: a, b, c.

    Explanation: These identity attack techniques are explicitly listed in the documentation.

31. Assume breach also supports proactive threat hunting and incident response. **(True/False)**

    Answer: True.

    Explanation: security teams can use telemetry data to trace attack paths, identify compromised assets, and contain threats.

32. What are the six interdependent Zero Trust pillars in Microsoft 365?

    Answer: Identity, Endpoints, Data, Applications, Infrastructure, and Network.

    Explanation: these six pillars as the domains where Zero Trust principles must be applied.

33. Which pillar is described as the cornerstone of Zero Trust?

    a. Identity
    b. Applications
    c. Data
    d. Infrastructure

    Answer: a. Identity.

    Explanation: explicitly states that identity is the cornerstone of Zero Trust.

34. Microsoft Entra ID provides which core identity capabilities? **(Select all that apply)**

    a. Centralized identity management
    b. Authentication
    c. Authorization
    d. Remote imaging

    Answer: a, b, c.

    Explanation: These three are named in the Identity section as core capabilities of Microsoft Entra ID.

35. Which passwordless sign-in examples are specifically listed? **(Select all that apply)**

    a. Windows Hello for Business
    b. FIDO2 security keys

c. Microsoft Authenticator

d. FTP shared passwords

Answer: a, b, c.

Explanation: These are the exact passwordless examples used in the Identity section.

36. Microsoft Entra ID supports identity federation, allowing users to sign in with credentials from external providers like Google or Facebook while still enforcing corporate policies. **(True/False)**

    Answer: True.

    Explanation: This sentence closely follows the wording used in the documentation.

37. In the context of the Zero Trust model, endpoints refers to what?

    Answer: Any device that connects to enterprise resources, including desktops, laptops, mobile phones, tablets, and even IoT devices.

    Explanation: endpoints broadly and notes that they are often the first target in cyberattacks.

38. Which tools are specifically highlighted for endpoint management and protection? **(Select all that apply)**

    a. Microsoft Intune

    b. Microsoft Defender for Endpoint

    c. Microsoft Purview Information Protection

    d. Azure Policy

    Answer: a, b.

    Explanation: The Endpoints section specifically names Intune and Defender for Endpoint.

39. Microsoft Intune enables administrators to define and enforce compliance policies that can require what? **(Select all that apply)**

    a. Encryption

    b. Antivirus protection

    c. Minimum OS versions

    d. Other security configurations

    Answer: a, b, c, d.

    Explanation: All four are listed as examples of compliance policy requirements.

40. Scenario: A user attempts to access Microsoft Teams from a jailbroken iPhone. Based on the documentation, what is the likely result?

    a. The user might be blocked due to noncompliance

    b. The user is automatically granted access

    c. Device compliance checks are skipped

    d. The device is trusted because it is mobile

    Answer: a. The user might be blocked due to noncompliance.

    Explanation: This is the specific example used in the Intune section.

41. What does Endpoint Analytics provide?

    a. Insights into device performance, user behavior, and configuration risks

    b. Email encryption only

    c. Passwordless sign-in only

    d. A replacement for Conditional Access

Answer: a. Insights into device performance, user behavior, and configuration risks.

Explanation: Endpoint Analytics is described as helping identify crashes, outdated software, and insecure settings.

42. Which Microsoft tool provides visibility into sanctioned and unsanctioned applications, also known as shadow IT?

    a. Microsoft Defender for Cloud Apps
    b. Microsoft Defender for Cloud
    c. Microsoft Intune
    d. Microsoft Purview Information Protection

    Answer: a. Microsoft Defender for Cloud Apps.

    Explanation: The Applications section explicitly identifies Defender for Cloud Apps as the tool for shadow IT visibility and control.

43. Microsoft Entra ID's App Proxy enables secure remote access to on-premises applications without exposing them to the internet. **(True/False)**

    Answer: True.

    Explanation: that App Proxy uses reverse proxy architecture and integrates with Conditional Access.

44. Microsoft Purview Information Protection allows organizations to do what?

    a. Classify, label, and encrypt sensitive data
    b. Restrict outbound traffic to known safe destinations
    c. Assign helpdesk roles
    d. Create VM size restrictions

    Answer: a. Classify, label, and encrypt sensitive data.

    Explanation: This is the primary function described in the Data pillar.

45. A document containing credit card numbers can be automatically labeled as "Confidential" and encrypted. **(True/False)**

    Answer: True.

    Explanation: this exact example to explain automatic labeling and encryption.

46. DLP policies prevent unauthorized sharing of sensitive information. **(True/False)**

    Answer: True.

    Explanation: DLP as a control to block, warn, or allow with justification when sensitive information is shared.

47. DLP integrates with which Microsoft 365 services? **(Select all that apply)**

    a. Exchange
    b. SharePoint
    c. OneDrive
    d. Teams

    Answer: a, b, c, d.

    Explanation: These are the exact services listed in the documentation.

48. Microsoft Defender for Cloud supports multicloud environments, including which platforms?

    a. Amazon Web Services and Google Cloud
    b. Only Microsoft Azure
    c. Only on-premises datacenters
    d. Only Microsoft 365 workloads

Answer: a. Amazon Web Services and Google Cloud.

Explanation: The Infrastructure section explicitly says Defender for Cloud supports multicloud environments including AWS and Google Cloud.

49. Which compliance standards are specifically mentioned in the Infrastructure section? **(Select all that apply)**

    a. ISO 27001
    b. National Institute of Standards and Technology (NIST)
    c. PCI DSS
    d. CIS Controls

    Answer: a, b.

    Explanation: ISO 27001 and NIST.

50. What is Azure Policy described as?

    Answer: A powerful governance tool that enables organizations to create, assign, and manage policies that enforce rules and effects across cloud resources.

    Explanation: The Infrastructure section introduces Azure Policy as the tool used to enforce consistent governance and prevent misconfigurations.

51. Which examples are given for Azure Policy enforcement? **(Select all that apply)**

    a. Restrict VM sizes
    b. Enforce tagging
    c. Require encryption
    d. Automatically isolate suspicious endpoints

    Answer: a, b, c.

    Explanation: These are the exact governance examples listed under Azure Policy.

52. Network segmentation and access control are essential in Zero Trust. **(True/False)**

    Answer: True.

    Explanation: The Network section begins by stating this directly.

53. Which technologies are explicitly mentioned in the Network pillar? **(Select all that apply)**

    a. Azure Firewall
    b. VPN Gateway
    c. Microsoft Defender for Identity
    d. Microsoft Authenticator

    Answer: a, b, c.

    Explanation: These are the named technologies used to monitor and control network traffic and detect lateral movement.

54. Scenario: An organization wants to restrict outbound traffic to known safe destinations to prevent data exfiltration. Which control best matches the documentation?

    a. Azure Firewall
    b. Endpoint Analytics
    c. Password Administrator role
    d. App Proxy

    Answer: a. Azure Firewall.

    Explanation: Azure Firewall can restrict outbound traffic to known safe destinations.

55. Defender for Identity monitors network traffic for signs of lateral movement, such as credential theft or unauthorized access. **(True/False)**

    Answer: True.

    Explanation: This statement closely follows the wording used in the Network section.

56. Put the three core Zero Trust principles in the order presented in the documentation.

    Answer: Verify explicitly, Least privilege access, Assume breach.

    Explanation: the principles in this exact order.

57. Scenario: A phishing email leads to credential theft. Which response best matches the layered defense strategy described in the documentation?

    a. Defender for Identity detects lateral movement, while Microsoft Sentinel correlates the event with other indicators of compromise
    b. Intune automatically changes all document labels to Confidential
    c. Azure Policy revokes all sign-in sessions for every user
    d. Endpoint Analytics creates a new Conditional Access policy automatically

    Answer: a. Defender for Identity detects lateral movement, while Microsoft Sentinel correlates the event with other indicators of compromise.

    Explanation: this example to show how Assume breach supports proactive threat hunting and incident response through layered defenses.

1.2

Implement Zero Trust in Microsoft 365

Abbreviation	Full Form
MFA	Multifactor authentication
DLP	Data Loss Prevention
HIPAA	Health Insurance Portability and Accountability Act
ISO	International Organization for Standardization
SIEM	Security Information and Event Management
XDR	Extended Detection and Response
BYOD	Bring-your-own-device
OS	Operating system
VM	Virtual machine
ID	Identity

1. Implementing Zero Trust in Microsoft 365 is best described as:

    a. A single product or feature
    b. A one-time configuration
    c. A continuous process that involves assessing your current environment, applying layered controls, and refining policies over time
    d. A process limited to identity protection only

    Answer: c. A continuous process that involves assessing your current environment, applying layered controls, and refining policies over time.

    Explanation: implementing Zero Trust in Microsoft 365 isn't a single product or feature, nor is it a one-time configuration.

2. A successful Zero Trust implementation requires coordination across teams, continuous monitoring, and iterative refinement. **(True/False)**

   Answer: True.

   Explanation: This statement follows the wording used in the opening paragraphs of the documentation.

3. The implementation strategy should be tailored to which factors? **(Select all that apply)**

   a. Your organization's risk profile
   b. Regulatory requirements
   c. Operational needs
   d. Personal user preferences only

   Answer: a, b, c.

   Explanation: the strategy should be tailored to risk profile, regulatory requirements, and operational needs.

4. How many phases are recommended for implementing Zero Trust effectively in Microsoft 365?

   a. Four
   b. Five
   c. Six
   d. Eight

   Answer: c. Six.

   Explanation: organizations should progress through six phases.

5. Put the six phases in the order presented in the documentation.

   Answer: Assess current security posture, Enable identity protection, Enforce endpoint compliance, Classify and protect data, Monitor and respond to threats, Educate users.

   Explanation: These are the six phases listed in sequence in the documentation.

6. What is the primary goal of Phase 1: Assess current security posture?

   a. Replace all existing security tools immediately
   b. Understand the existing security configuration and identify areas for improvement
   c. Train all users before reviewing any controls
   d. Enforce DLP across all workloads first

   Answer: b. Understand the existing security configuration and identify areas for improvement.

   Explanation: assessment as the foundational step so controls are applied where they are most needed.

7. Before implementing Zero Trust, organizations must identify which resources are most critical, who accesses them, and under what conditions. **(True/False)**

   Answer: True.

   Explanation: this visibility enables targeted controls without disrupting productivity.

8. Which tools are named as excellent starting points for assessing current security posture? **(Select all that apply)**

   a. Microsoft Secure Score
   b. Microsoft Purview Compliance Manager
   c. Microsoft Viva Learning
   d. Microsoft Sentinel hunting queries

   Answer: a, b.

   Explanation: specifically identifies these two tools as starting points for assessment.

9. Microsoft Secure Score provides what kind of measure?

   a. A quantitative measure of your security posture across Microsoft 365 services
   b. A legal risk score for contracts only
   c. A device battery health score
   d. A user productivity score

   Answer: a. A quantitative measure of your security posture across Microsoft 365 services.

   Explanation: This is the exact role given to Microsoft Secure Score in the documentation.

10. Which gaps are given as examples that Microsoft Secure Score can identify? **(Select all that apply)**

    a. Missing MFA enforcement
    b. Outdated DLP policies
    c. Excessive administrative privileges
    d. Overused Teams emojis

    Answer: a, b, c.

    Explanation: These are the specific examples named in the Secure Score section.

11. A Secure Score of 45 out of 100 might indicate that users aren't required to use MFA and that sensitive data isn't being labeled or protected. **(True/False)**

    Answer: True.

    Explanation: this exact example to illustrate how Secure Score can expose gaps.

12. Which recommendations are specifically listed on the Secure Score dashboard? **(Select all that apply)**

    a. Enabling MFA for all users
    b. Configuring Conditional Access policies
    c. Applying sensitivity labels
    d. Replacing Microsoft Entra ID with a third-party directory

    Answer: a, b, c.

    Explanation: These are the specific recommendations listed in the documentation.

13. Microsoft Purview Compliance Manager helps assess what?

    a. Regulatory compliance
    b. Only laptop performance
    c. VPN throughput
    d. User awareness maturity only

    Answer: a. Regulatory compliance.

    Explanation: Compliance Manager maps configurations to standards and provides improvement actions.

14. Which standards are explicitly mentioned for Microsoft Purview Compliance Manager mapping? **(Select all that apply)**

    a. HIPAA
    b. ISO 27001
    c. PCI DSS
    d. SOC 1

    Answer: a, b.

    Explanation: specifically names HIPAA and ISO 27001.

15. Phase 2 focuses on identity because identity serves as the first and most critical control plane. **(True/False)**

    Answer: True.

    Explanation: that identity governs access to nearly every resource in Microsoft 365.

16. Configuring identity protection early helps achieve which outcomes? **(Select all that apply)**

    a. Prevent unauthorized access
    b. Reduce the risk of credential-based attacks
    c. Ensure that only verified users and devices can interact with sensitive resources
    d. Remove the need for regulatory compliance

    Answer: a, b, c.

    Explanation: early identity protection lays the groundwork for securing the remaining pillars while supporting agility and compliance.

17. According to the documentation, securing identity isn't just about authentication. It is also about continuously evaluating the trustworthiness of every access attempt. **(True/False)**

    Answer: True.

    Explanation: This statement closely matches the wording in the identity protection section.

18. Identity protection includes assessing which signals in real time? **(Select all that apply)**

    a. User behavior
    b. Device health
    c. Location
    d. Risk signals
    e. Screen brightness

    Answer: a, b, c, d.

    Explanation: These are the specific real-time signals named in the documentation.

19. Microsoft 365 provides a comprehensive identity protection framework through which product?

    a. Microsoft Entra ID
    b. Microsoft Viva Learning
    c. Azure Firewall
    d. Endpoint Analytics

    Answer: a. Microsoft Entra ID.

    Explanation: Microsoft Entra ID integrates Conditional Access, risk-based authentication, and identity governance.

20. Conditional Access policies allow administrators to define rules based on which factors? **(Select all that apply)**

    a. User
    b. Device
    c. Location
    d. Risk level

    Answer: a, b, c, d.

    Explanation: these four factors when describing Conditional Access in Phase 2.

21. Scenario: A policy requires MFA for users accessing SharePoint Online from outside the corporate network or blocks access if the device is unmanaged. Which phase does this best illustrate?

    a. Assess current security posture

b. Enable identity protection
c. Enforce endpoint compliance
d. Educate users

Answer: b. Enable identity protection.

Explanation: This is the exact type of Conditional Access policy example given in Phase 2.

22. Risky sign-ins can be automatically remediated through which actions? **(Select all that apply)**

a. Requiring password resets
b. Blocking access
c. Disabling all sensitivity labels
d. Granting temporary global admin rights

Answer: a, b.

Explanation: risky sign-ins can be automatically remediated, such as requiring password resets or blocking access.

23. Risk-based authentication uses machine learning and global threat intelligence to evaluate sign-in risk. **(True/False)**

Answer: True.

Explanation: This statement follows the wording used in the risk-based authentication section.

24. Which anomalies are specifically listed for risk-based authentication? **(Select all that apply)**

a. Impossible travel
b. Unfamiliar sign-in properties
c. Known compromised credentials
d. Excessive mailbox size

Answer: a, b, c.

Explanation: These are the exact anomalies named in the documentation.

25. Scenario: A user logs in from two separate locations within minutes of each other. What might this trigger?

a. A high-risk sign-in
b. Automatic license assignment
c. A sensitivity label downgrade
d. Immediate deletion of the account

Answer: a. A high-risk sign-in.

Explanation: this impossible travel example to explain risk-based authentication.

26. Identity governance ensures that users retain only the permissions they need through which features? **(Select all that apply)**

a. Access reviews
b. Entitlement management
c. Attack simulation training
d. Endpoint Analytics

Answer: a, b.

Explanation: access reviews and entitlement management as identity governance features.

27. Temporary project members can be granted access for a limited time, with automatic expiration and review. **(True/False)**

    Answer: True.

    Explanation: this example to show how identity governance reduces privilege creep and supports compliance.

28. Phase 3 focuses on which objective?

    a. Enforce endpoint compliance
    b. Classify and protect data
    c. Monitor and respond to threats
    d. Educate users

    Answer: a. Enforce endpoint compliance.

    Explanation: Phase 3 is specifically titled Enforce endpoint compliance.

29. Endpoint compliance is critical because endpoints are the devices through which users access corporate resources. **(True/False)**

    Answer: True.

    Explanation: endpoints in exactly this way.

30. Microsoft Intune provides tools for which functions? **(Select all that apply)**

    a. Managing endpoints
    b. Protecting endpoints
    c. Enforcing compliance policies
    d. Monitoring device health

    Answer: a, b, c, d.

    Explanation: Intune tools manage and protect endpoints, enforce compliance, and monitor device health.

31. Endpoint compliance policies allow administrators to check for which conditions? **(Select all that apply)**

    a. Encryption
    b. Antivirus status
    c. OS version
    d. More device requirements

    Answer: a, b, c, d.

    Explanation: compliance policies check for encryption, antivirus status, OS version, and more.

32. Scenario: A policy requires Windows devices to have BitLocker enabled and be running the latest security patches. If a user attempts to access OneDrive from a noncompliant device, what happens?

    a. Access is denied until the device meets the requirements
    b. OneDrive ignores compliance status
    c. The device is marked compliant automatically
    d. The user receives global administrator rights

    Answer: a. Access is denied until the device meets the requirements.

    Explanation: This scenario follows the exact example used in the endpoint compliance policies section.

33. App protection policies enforce what at the application level?

    a. Data encryption and isolation
    b. VM tagging and sizing

c. Password resets only
d. Firewall route updates

Answer: a. Data encryption and isolation.

Explanation: app protection policies enforce data encryption and isolation at the application level.

34. Which scenario is specifically given for app protection policies in BYOD environments? **(Select all that apply)**

    a. Outlook on iOS can prevent copy-paste actions
    b. Outlook on iOS can require PIN protection
    c. Outlook on iOS can encrypt data
    d. Teams can be restricted to read-only mode on personal devices

    Answer: a, b, c, d.

    Explanation: All four are explicitly given as examples of app protection behavior.

35. Endpoint Analytics provides insights into device performance, user behavior, and configuration risks. **(True/False)**

    Answer: True.

    Explanation: This sentence directly follows the wording in the Endpoint Analytics section.

36. Phase 4 is titled:

    a. Enable identity protection
    b. Classify and protect data
    c. Monitor and respond to threats
    d. Educate users

    Answer: b. Classify and protect data.

    Explanation: Phase 4 is specifically named Classify and protect data.

37. According to the documentation, data is the target of most attacks. **(True/False)**

    Answer: True.

    Explanation: this statement to explain why classification and protection are central to Zero Trust.

38. Protecting data requires which capabilities? **(Select all that apply)**

    a. Classification
    b. Labeling
    c. Encryption
    d. Policy enforcement

    Answer: a, b, c, d.

    Explanation: all four as essential parts of protecting data.

39. Which tools are named for data classification and protection? **(Select all that apply)**

    a. Microsoft Purview Information Protection
    b. Data Loss Prevention
    c. Microsoft Defender for Identity
    d. Endpoint Analytics

    Answer: a, b.

    Explanation: these tools together in Phase 4.

40. Sensitivity labels can be applied how?

a. Only manually
b. Only automatically
c. Manually or automatically
d. Only by global administrators

Answer: c. Manually or automatically.

Explanation: that labels can be applied manually or automatically.

41. Scenario: A document containing credit card numbers is automatically labeled as "Confidential" and encrypted. What can the label do? **(Select all that apply)**

    a. Restrict access to only authorized users
    b. Block external sharing
    c. Persist across services
    d. Remove all audit logging

    Answer: a, b, c.

    Explanation: These are the specific label outcomes described in the documentation.

42. Emails labeled "Highly Confidential" can be restricted to internal recipients and require MFA for access. **(True/False)**

    Answer: True.

    Explanation: provides this exact example under sensitivity labels.

43. DLP policies can be tailored to which dimensions? **(Select all that apply)**

    a. Specific departments
    b. Data types
    c. Risk levels
    d. Screen resolutions

    Answer: a, b, c.

    Explanation: DLP policies can be tailored to specific departments, data types, and risk levels.

44. Policy tuning and incident response help administrators do what? **(Select all that apply)**

    a. Monitor policy violations
    b. Investigate incidents
    c. Refine rules based on feedback
    d. Eliminate all false positives permanently

    Answer: a, b, c.

    Explanation: these as the core elements of effective data protection and continuous improvement.

45. If a DLP policy generates too many false positives, what does the documentation suggest?

    a. Adjust the policy to better match business workflows
    b. Disable all DLP policies permanently
    c. Remove Exchange from Microsoft 365
    d. Convert the policy into a Conditional Access policy

    Answer: a. Adjust the policy to better match business workflows.

    Explanation: false positives are a signal that policy tuning may be needed.

46. Phase 5 focuses on which capability?

    a. Monitor and respond to threats

b. Enforce endpoint compliance

c. Educate users

d. Assess current security posture

Answer: a. Monitor and respond to threats.

Explanation: This is the title of Phase 5 in the documentation.

47. Zero Trust isn't just about preventing unauthorized access; it's also about detecting and responding to threats in real time. **(True/False)**

    Answer: True.

    Explanation: explicitly makes this distinction at the start of Phase 5.

48. Which tools are named as supporting continuous monitoring and rapid incident response? **(Select all that apply)**

    a. Microsoft Defender for Endpoint

    b. Microsoft Sentinel

    c. Microsoft Defender for Identity

    d. Microsoft Viva Learning

    Answer: a, b, c.

    Explanation: These three integrated tools are named in Phase 5.

49. Microsoft Defender for Endpoint monitors for which indicators? **(Select all that apply)**

    a. Unusual process execution

    b. Privilege escalation

    c. Lateral movement

    d. License assignment drift

    Answer: a, b, c.

    Explanation: These are the specific indicators listed in the Defender for Endpoint section.

50. Scenario: Defender detects that a device is communicating with a known command-and-control server. What can it do automatically?

    a. Isolate the device from the network

    b. Lower the device risk score only after 30 days

    c. Create a sensitivity label

    d. Disable all Teams meetings

    Answer: a. Isolate the device from the network.

    Explanation: automatic isolation can prevent further spread.

51. Microsoft Defender for Endpoint integrates with Microsoft Intune to enforce remediation actions such as resetting the device or revoking access. **(True/False)**

    Answer: True.

    Explanation: this tight integration as a way to ensure immediate containment.

52. Microsoft Sentinel is described as what kind of solution?

    a. A cloud-native Security Information and Event Management solution

    b. A desktop imaging tool

    c. A role assignment engine

    d. A password manager only

Answer: a. A cloud-native Security Information and Event Management solution.

Explanation: explicitly describes Microsoft Sentinel as a cloud-native SIEM solution.

53. Which Microsoft Sentinel capabilities are specifically mentioned? **(Select all that apply)**

    a. Correlating events and identifying multi-stage attacks
    b. Triggering automated playbooks
    c. Building dashboards to monitor key metrics
    d. Supporting hunting queries

    Answer: a, b, c, d.

    Explanation: All four are directly named in the documentation.

54. Microsoft Defender for Identity focuses on monitoring which traffic for signs of compromise?

    a. On-premises Active Directory domain controller traffic
    b. Only Exchange Online mail flow
    c. Only Teams chat traffic
    d. Only Azure Firewall logs

    Answer: a. On-premises Active Directory domain controller traffic.

    Explanation: clearly states that its telemetry is centered on on-premises Active Directory.

55. Microsoft Defender for Identity works alongside Microsoft Entra ID Protection within Microsoft Defender XDR, giving analysts a unified, correlated view of identity threats across hybrid environments. **(True/False)**

    Answer: True.

    Explanation: This statement closely follows the wording used in the documentation.

56. In the documentation, lateral movement is described as attackers moving "laterally" across systems until they reach what kinds of goals? **(Select all that apply)**

    a. Domain administrator privileges
    b. Sensitive data repositories
    c. Wallpaper synchronization
    d. Boot time optimization

    Answer: a, b.

    Explanation: These are the exact examples given for attackers' ultimate goals.

57. Phase 6 focuses on which activity?

    a. Educate users
    b. Monitor and respond to threats
    c. Enforce endpoint compliance
    d. Classify and protect data

    Answer: a. Educate users.

    Explanation: Phase 6 is titled Educate users.

58. Human error can undermine even the most advanced technical controls. **(True/False)**

    Answer: True.

    Explanation: users are often the weakest link in the security chain, making education critical.

59. Which tools are named for helping organizations train users and support ongoing education? **(Select all that apply)**

a. Microsoft Defender for Office 365
b. Microsoft Viva Learning
c. Microsoft Secure Score
d. Azure Policy

Answer: a, b.

Explanation: These two tools are explicitly named in Phase 6.

60. Attack simulation training in Defender for Office 365 allows organizations to conduct what kind of exercises?

a. Realistic phishing simulations
b. Disk encryption validation only
c. VM migration rehearsals only
d. Network throughput tests only

Answer: a. Realistic phishing simulations.

Explanation: these simulations mimic real-world attacks like credential harvesting or business email compromise.

61. Scenario: Users select malicious links in a simulated phishing campaign. According to the documentation, what happens next?

a. They are redirected to training modules that explain the risks and best practices
b. Their Microsoft 365 license is removed immediately
c. All their Teams chats are deleted
d. Their device is automatically quarantined for 30 days

Answer: a. They are redirected to training modules that explain the risks and best practices.

Explanation: This is the exact workflow described under attack simulation training.

62. Security awareness campaigns can be delivered through which channels? **(Select all that apply)**

a. Microsoft Viva Learning
b. Microsoft Teams
c. Email
d. BIOS update prompts only

Answer: a, b, c.

Explanation: Viva Learning, Teams, and email as delivery channels for awareness campaigns.

63. Which concepts are specifically mentioned as being reinforced by security awareness campaigns? **(Select all that apply)**

a. Password hygiene
b. Data handling
c. Incident reporting
d. Unmanaged device rooting

Answer: a, b, c.

Explanation: These are the exact concepts listed in the documentation.

64. Role-specific training is valuable because different users face different risks and responsibilities. **(True/False)**

Answer: True.

Explanation: tailored training is critical because different roles need different guidance.

65. Which examples of role-specific training are given? **(Select all that apply)**

a. Finance staff recognizing invoice fraud
b. Developers learning secure coding practices
c. Executives and board members receiving briefings on strategic risks and compliance obligations
d. All users learning the same single generic module only

Answer: a, b, c.

Explanation: These are the specific examples used in the role-specific training section.

66. Which statement best summarizes the user education phase of Zero Trust implementation?

a. Security should be embedded into the organizational culture so users act as the frontline of defense
b. User education is optional once Conditional Access is enabled
c. Only administrators need training
d. Awareness campaigns should be one-time events

Answer: a. Security should be embedded into the organizational culture so users act as the frontline of defense.

Explanation: organizations should embed security into their culture and empower users to act as the frontline of defense.

1.3

Examine Threat Protection and Intelligence in Microsoft 365

Abbreviation	Full Form
XDR	Extended Detection and Response
BEC	Business Email Compromise
EDR	Endpoint Detection and Response
DLP	Data Loss Prevention
MSTIC	Microsoft Threat Intelligence Center
SIEM	Security Information and Event Management
AI	Artificial Intelligence
URL	Uniform Resource Locator
IP	Internet Protocol
MITRE ATT&CK	MITRE Adversarial Tactics, Techniques, and Common Knowledge

1. Microsoft 365's threat protection and intelligence capabilities are at the heart of what?

   a. Traditional perimeter security only

   b. Modern enterprise security

   c. Consumer antivirus only

   d. Basic password policy enforcement only

   Answer: b. Modern enterprise security.

   Explanation: opens by stating that Microsoft 365's threat protection and intelligence capabilities are at the heart of modern enterprise security.

2. Why are integrated security solutions essential in Microsoft 365?

   a. Because organizations increasingly rely on cloud-based collaboration and productivity tools, expanding the attack surface

   b. Because attackers only use spam now

   c. Because endpoint protection is no longer needed

   d. Because email is the only workload at risk

   Answer: a. Because organizations increasingly rely on cloud-based collaboration and productivity tools, expanding the attack surface.

   Explanation: directly ties the expanding attack surface to increased cloud-based collaboration and productivity usage.

3. Microsoft 365 brings together a suite of tools that work in concert to detect, investigate, and respond to threats across which areas? **(Select all that apply)**

   a. Email

   b. Endpoints

   c. Identities

   d. Applications

   e. Only on-premises file servers

Answer: a, b, c, d.

Explanation: Microsoft 365 brings together tools across email, endpoints, identities, and applications.

4. Threats today aren't limited to malware or spam. Which advanced techniques are explicitly named? **(Select all that apply)**

   a. Phishing
   b. Business email compromise
   c. Credential theft
   d. Lateral movement
   e. Printer queue overflow

   Answer: a, b, c, d.

   Explanation: These are the exact advanced threat techniques listed in the documentation.

5. The Microsoft 365 Defender suite utilizes artificial intelligence, machine learning, and vast global telemetry to identify and block threats before they cause harm. **(True/False)**

   Answer: True.

   Explanation: This statement follows the wording used in the introductory overview of the Defender suite.

6. By integrating protection across workloads such as Exchange Online, Teams, SharePoint, and OneDrive, Microsoft 365 ensures security is:

   a. Siloed and fragmented
   b. Unified and adaptive
   c. Limited to email only
   d. Static and manual

   Answer: b. Unified and adaptive.

   Explanation: security isn't siloed, but unified and adaptive.

7. Microsoft Defender XDR is best described as:

   a. A mail flow rule engine only
   b. A comprehensive security solution designed to protect organizations from both known and emerging threats
   c. A data classification tool only
   d. An endpoint compliance reporting dashboard only

   Answer: b. A comprehensive security solution designed to protect organizations from both known and emerging threats.

   Explanation: Microsoft Defender XDR using this exact description.

8. Unlike traditional security tools that operate in isolation, Defender coordinates which functions across multiple Microsoft 365 services? **(Select all that apply)**

   a. Detection
   b. Prevention
   c. Investigation
   d. Response
   e. Manual payroll processing

   Answer: a, b, c, d.

   Explanation: These four functions are listed in the Defender XDR overview.

9. Defender XDR addresses both pre-breach and post-breach scenarios. **(True/False)**

   Answer: True.

   Explanation: Defender blocks malicious activity in pre-breach scenarios and provides investigation and response in post-breach scenarios.

10. In pre-breach scenarios, Defender uses advanced analytics and threat intelligence to do what?

    a. Block malicious activity before it reaches users
    b. Decommission all risky devices automatically
    c. Replace sensitivity labels with transport rules
    d. Remove user mailboxes proactively

    Answer: a. Block malicious activity before it reaches users.

    Explanation: This is the exact pre-breach role described in the documentation.

11. In post-breach scenarios, Defender provides which capability?

    a. Powerful investigation and response tools to contain and remediate incidents
    b. Only password expiration reports
    c. Only device inventory export
    d. Only spam quarantine release

    Answer: a. Powerful investigation and response tools to contain and remediate incidents.

    Explanation: post-breach capabilities are critical because attackers often use multi-stage campaigns.

12. Defender benefits from trillions of signals collected daily across which Microsoft platforms? **(Select all that apply)**

    a. Azure
    b. Office 365
    c. Windows
    d. More Microsoft security infrastructure

    Answer: a, b, c, d.

    Explanation: Defender benefits from trillions of signals collected daily across Azure, Office 365, Windows, and more.

13. Scenario: A new phishing campaign is detected in one region. According to the documentation, what can Defender do?

    a. Block similar attacks worldwide within minutes
    b. Wait for quarterly signature updates
    c. Require each tenant to build a manual block list
    d. Disable mail flow globally

    Answer: a. Block similar attacks worldwide within minutes.

    Explanation: this example to show how Defender adapts in real time using global intelligence.

14. Which products are listed as key components of Microsoft Defender XDR? **(Select all that apply)**

    a. Defender for Office 365
    b. Defender for Endpoint
    c. Defender for Identity
    d. Defender for Cloud Apps

Answer: a, b, c, d.

Explanation: These are the four key components explicitly listed in the documentation.

15. Defender for Office 365 protects which workloads or threat areas?

    a. Email and collaboration tools against phishing, BEC, malware, and other threats
    b. Only device compliance posture
    c. Only virtual machine configurations
    d. Only insider risk labels

    Answer: a. Email and collaboration tools against phishing, BEC, malware, and other threats.

    Explanation: This is the role assigned to Defender for Office 365 in the component breakdown.

16. Scenario: An employee receives an email that appears to be from a trusted source but contains a link to a fake sign-in page. What does Defender for Office 365 do?

    a. Scans the URL and blocks access before damage occurs
    b. Converts the email into a Teams post
    c. Automatically resets all user passwords organization-wide
    d. Ignores the message unless the user reports it

    Answer: a. Scans the URL and blocks access before damage occurs.

    Explanation: This scenario is directly described in the Defender for Office 365 example.

17. Defender for Endpoint provides which capabilities? **(Select all that apply)**

    a. Advanced endpoint detection and response
    b. Antivirus protection
    c. Attack surface reduction
    d. Automated investigation and response

    Answer: a, b, c, d.

    Explanation: All four are explicitly listed in the documentation.

18. Scenario: Ransomware is detected on a user's laptop. According to the documentation, what can Defender for Endpoint do?

    a. Quarantine the device to prevent the spread of the attack
    b. Upgrade the device to the latest Windows edition automatically
    c. Disable all mail flow rules
    d. Publish a compliance report to users

    Answer: a. Quarantine the device to prevent the spread of the attack.

    Explanation: ransomware quarantine as a specific Defender for Endpoint example.

19. Defender for Identity uses signals from on-premises Active Directory to identify which identity-based threats? **(Select all that apply)**

    a. Lateral movement
    b. Pass-the-hash attacks
    c. Suspicious Kerberos ticket activity
    d. Credential theft attempts

    Answer: a, b, c, d.

    Explanation: These are all explicitly mentioned in the Defender for Identity description.

20. Scenario: An attacker tries to use stolen credentials to move laterally within the network. What does Defender for Identity do?

    a. Generates an alert to enable rapid response
    b. Automatically archives the user's mailbox
    c. Converts the alert into a DLP policy
    d. Disables all SharePoint sites

    Answer: a. Generates an alert to enable rapid response.

    Explanation: This is the exact example used in the Defender for Identity section.

21. Defender for Cloud Apps provides visibility and control over which areas? **(Select all that apply)**

    a. Shadow IT discovery
    b. App governance
    c. Data exfiltration prevention
    d. BIOS firmware rollback

    Answer: a, b, c.

    Explanation: These are the three specific areas listed under Defender for Cloud Apps.

22. Scenario: An employee tries to move confidential files to a personal Dropbox account. What can Defender for Cloud Apps do?

    a. Flag the activity and allow security teams to take action
    b. Treat Dropbox as a managed corporate repository automatically
    c. Convert the files into safe links
    d. Disable OneDrive tenant-wide

    Answer: a. Flag the activity and allow security teams to take action.

    Explanation: a personal Dropbox example to illustrate data exfiltration detection.

23. Microsoft Purview is a component of the Defender XDR suite. **(True/False)**

    Answer: False.

    Explanation: Purview isn't a component of the Defender XDR suite, although it integrates with Defender for real-world operations.

24. Microsoft Defender XDR integrates with Microsoft Purview for which use cases? **(Select all that apply)**

    a. Data security investigations
    b. Insider risk management
    c. Unified security and compliance workflows
    d. Endpoint driver updates

    Answer: a, b, c.

    Explanation: These integration scenarios are explicitly described in the Purview integration section.

25. Purview services are designed to complement Defender XDR by providing which capabilities? **(Select all that apply)**

    a. Compliance
    b. Governance
    c. Data protection
    d. Router firmware management

Answer: a, b, c.

Explanation: Purview complements Defender XDR with compliance, governance, and data protection capabilities.

26. Scenario: A user attempts to email a sensitive document to an external recipient. According to the documentation, what can Purview do?

    a. Block the action or require further approval
    b. Convert the email into a Teams message
    c. Change the user's Entra role automatically
    d. Disable Defender alerts for that user

    Answer: a. Block the action or require further approval.

    Explanation: The Purview section uses this exact example to show how data exposure can be reduced.

27. Microsoft 365 uses multiple layers of defense to ensure threats are detected and blocked at every stage of the attack lifecycle. **(True/False)**

    Answer: True.

    Explanation: This statement closely follows the wording used in the Core threat protection features section.

28. Which common and dangerous attack vectors are specifically highlighted for Microsoft 365 protection?

    a. Phishing, malware, and spam
    b. Only ransomware and insider risk
    c. Only network denial-of-service attacks
    d. Only mobile device theft

    Answer: a. Phishing, malware, and spam.

    Explanation: the following sections examine phishing, malware, and spam in greater detail.

29. Microsoft 365's anti-phishing capabilities combine which features? **(Select all that apply)**

    a. Spoof intelligence
    b. Impersonation protection
    c. Real-time URL scanning
    d. Offline backup rotation

    Answer: a, b, c.

    Explanation: These are the three anti-phishing features named in the overview section.

30. Spoof intelligence identifies when senders impersonate trusted domains. **(True/False)**

    Answer: True.

    Explanation: the example of an email claiming to be from a trusted domain but sent from an unauthorized IP.

31. Which example best illustrates impersonation protection?

    a. An email from ceo@yourcompany.net trying to impersonate the CEO
    b. A legitimate email from payroll@yourcompany.com
    c. A Teams status update from a verified user
    d. An internal SharePoint alert from a trusted workflow

    Answer: a. An email from ceo@yourcompany.net trying to impersonate the CEO.

    Explanation: This exact example is used in the anti-phishing section.

32. User and domain impersonation detection further enhances security by identifying what kind of domains?

a. Lookalike domains such as support@micros0ft.com
b. Only domains registered internally
c. Only domains that use SPF
d. Domains with no MX records

Answer: a. Lookalike domains such as support@micros0ft.com.

Explanation: this exact example to describe character substitution deception.

33. What does Safe Links do?

a. Rewrites URLs in messages and scans them at the time of selection
b. Encrypts all email attachments automatically
c. Converts suspicious messages into spam only
d. Blocks all external hyperlinks permanently

Answer: a. Rewrites URLs in messages and scans them at the time of selection.

Explanation: This is the core Safe Links behavior described in the documentation.

34. Scenario: A user receives a link to a SharePoint document that is later replaced with malware. How does Safe Links protect the user?

a. It scans the URL in real time and blocks access
b. It deletes the SharePoint site automatically
c. It disables all links in Exchange Online permanently
d. It moves the message to Deleted Items only after user selection

Answer: a. It scans the URL in real time and blocks access.

Explanation: This exact evolving-threat example is provided in the anti-phishing section.

35. Microsoft 365 uses multiple scanning engines to detect and block malware across which workloads? **(Select all that apply)**

a. Exchange Online
b. SharePoint
c. OneDrive
d. Teams

Answer: a, b, c, d.

Explanation: All four workloads are explicitly named in the anti-malware section.

36. What is Zero-hour Auto Purge (ZAP) described as doing?

a. Retroactively removing malicious messages from mailboxes after new threats are identified
b. Deleting all spam rules every hour
c. Rotating device certificates automatically
d. Purging inactive Teams channels

Answer: a. Retroactively removing malicious messages from mailboxes after new threats are identified.

Explanation: ZAP in exactly these terms.

37. Scenario: Malware is initially undetected but later recognized through a definition update. What does ZAP do?

a. Automatically purges it from all affected mailboxes
b. Sends it back to the original sender
c. Labels the message as Highly Confidential

d. Converts it into a quarantine release request only

Answer: a. Automatically purges it from all affected mailboxes.

Explanation: This is the exact example used in the anti-malware section.

38. Which file types are specifically mentioned as examples that common attachment filter policies can block? **(Select all that apply)**

    a. .exe
    b. .js
    c. .vbs
    d. .png

    Answer: a, b, c.

    Explanation: these executable file types as common malware delivery formats.

39. Scenario: An email arrives with an invoice.js attachment. According to the documentation, what happens?

    a. It would be quarantined automatically
    b. It would be routed to the inbox because it looks financial
    c. It would bypass all anti-malware checks
    d. It would be converted to a PDF automatically

    Answer: a. It would be quarantined automatically.

    Explanation: This is the exact example used to explain common attachment filter policies.

40. Spam filtering in Microsoft 365 uses which techniques? **(Select all that apply)**

    a. Heuristics
    b. Machine learning models
    c. Reputation-based analysis
    d. Physical badge validation

    Answer: a, b, c.

    Explanation: These are the techniques listed in the anti-spam section.

41. To improve accuracy over time, the spam filtering system continuously learns from which user actions? **(Select all that apply)**

    a. Marking messages as junk
    b. Marking messages as not junk
    c. Manually printing suspicious emails
    d. Renaming inbox folders

    Answer: a, b.

    Explanation: the system continuously learns from users marking messages as junk or not junk.

42. Transport rules are also known as what?

    a. Mail flow rules
    b. Endpoint response policies
    c. Identity governance rules
    d. Purview labeling rules

    Answer: a. Mail flow rules.

    Explanation: transport rules are also known as mail flow rules.

43. Scenario: An organization wants to block any email from external domains that includes “wire transfer” in the subject line. Which feature best matches this need?

    a. Transport rules
    b. Safe Links
    c. Endpoint Analytics
    d. Threat Analytics

    Answer: a. Transport rules.

    Explanation: this specific type of mail flow rule example to reduce financial fraud.

44. Which additional email protection features are specifically mentioned? **(Select all that apply)**

    a. Connection filtering
    b. Outbound spam protection
    c. Quarantine policies
    d. Identity federation

    Answer: a, b, c.

    Explanation: These are listed in the anti-spam and transport rules section as layered email controls.

45. Scenario: A legitimate business partner’s email is mistakenly classified as spam. What can an admin do?

    a. Release it from quarantine and mark the sender as trusted
    b. Delete the partner from Entra ID permanently
    c. Disable spam filtering for the entire tenant
    d. Move all external mail to Deleted Items

    Answer: a. Release it from quarantine and mark the sender as trusted.

    Explanation: this exact quarantine policy example.

46. Threat intelligence in Microsoft 365 helps organizations move from reactive defense to proactive protection. **(True/False)**

    Answer: True.

    Explanation: This statement directly reflects the wording in the threat intelligence overview.

47. Microsoft 365 threat intelligence is described as helping organizations understand which broader questions? **(Select all that apply)**

    a. Who is attacking
    b. What methods they use
    c. Which assets are at risk
    d. Which printer model is most common

    Answer: a, b, c.

    Explanation: explicitly frames threat intelligence around understanding attackers, methods, and assets at risk.

48. Rather than relying solely on static signatures or isolated alerts, Microsoft 365 combines real-time data from which platforms? **(Select all that apply)**

    a. Cloud platforms
    b. Endpoint platforms
    c. Identity platforms
    d. Only local syslog servers

Answer: a, b, c.

Explanation: Microsoft 365 combines real-time data from cloud, endpoint, and identity platforms.

49. Which users are specifically called out as benefiting from threat intelligence tools?

    a. IT administrators and security professionals
    b. Only executive assistants
    c. Only external auditors
    d. Only helpdesk interns

    Answer: a. IT administrators and security professionals.

    Explanation: specifically identifies IT administrators and security professionals as the audience for these tools.

50. What is MSTIC described as?

    a. The nerve center of Microsoft's global security operations
    b. A password reset portal
    c. A quarantine release dashboard
    d. A local-only Windows service

    Answer: a. The nerve center of Microsoft's global security operations.

    Explanation: explicitly describes MSTIC in these terms.

51. How many signals daily does MSTIC monitor according to the documentation?

    a. Over 6.5 billion
    b. Over 65 trillion
    c. Over 650 million
    d. Over 650 trillion

    Answer: b. Over 65 trillion.

    Explanation: that MSTIC monitors over 65 trillion signals daily.

52. MSTIC analysts do more than automated detection. Which activities are specifically mentioned? **(Select all that apply)**

    a. Investigating nation-state actors
    b. Monitoring the dark web
    c. Collaborating with law enforcement and industry partners
    d. Replacing all tenant administrators

    Answer: a, b, c.

    Explanation: These are the human expertise activities listed in the MSTIC section.

53. If MSTIC identifies a new phishing campaign targeting financial institutions, what can happen?

    a. Microsoft 365's filters can be rapidly updated to block similar attacks across all tenants
    b. Only one tenant receives a manual advisory after several weeks
    c. The campaign is ignored unless a device is compromised
    d. Exchange Online mail flow stops globally

    Answer: a. Microsoft 365's filters can be rapidly updated to block similar attacks across all tenants.

    Explanation: this exact example to illustrate proactive protection from MSTIC intelligence.

54. Dark web monitoring is described as important because the dark web is a marketplace for which items? **(Select all that apply)**

a. Stolen credentials
b. Malware
c. Attack tools
d. Sensitivity label schemas

Answer: a, b, c.

Explanation: These are the three categories explicitly named in the dark web monitoring section.

55. If stolen credentials for a Microsoft 365 tenant are found for sale, what remediation steps are recommended? **(Select all that apply)**

a. Password resets
b. Enhanced monitoring
c. Disabling all SharePoint sites permanently
d. Immediate remediation steps for the affected organization

Answer: a, b, d.

Explanation: mentions notification plus remediation steps such as password resets and enhanced monitoring.

56. Threat Explorer is available in which licensing plan?

a. Microsoft Defender for Office 365 Plan 2
b. Microsoft Entra Free
c. Exchange Online Kiosk
d. Windows Pro only

Answer: a. Microsoft Defender for Office 365 Plan 2.

Explanation: explicitly states that Threat Explorer is available in Defender for Office 365 Plan 2.

57. Threat Explorer provides security teams with what kind of visibility?

a. Real-time visibility into threats targeting their organization
b. Quarterly-only reporting visibility
c. Visibility limited to endpoint boot performance
d. Visibility only into user training completion

Answer: a. Real-time visibility into threats targeting their organization.

Explanation: contrasts Threat Explorer with static reports or delayed alerts.

58. Which dimensions can administrators pivot across in Threat Explorer? **(Select all that apply)**

a. Sender
b. Subject
c. URL
d. File hash

Answer: a, b, c, d.

Explanation: All four are explicitly named as pivot dimensions in Threat Explorer.

59. Scenario: A user reports a phishing email. What can Threat Explorer quickly reveal?

a. Whether other users received or interacted with the same message
b. Only whether the user opened Teams today
c. Only whether the device is compliant with Intune
d. Only whether the mailbox has a DLP label

Answer: a. Whether other users received or interacted with the same message.

Explanation: this exact example to show coordinated investigation and response.

60. Threat Explorer can show which message outcomes? **(Select all that apply)**

    a. Delivered
    b. Blocked
    c. Selected by users
    d. Converted to a sensitivity label

    Answer: a, b, c.

    Explanation: Threat Explorer shows delivery status and user impact, including whether a message was delivered, blocked, or selected.

61. Threat Analytics is best described as:

    a. A curated library of threat intelligence reports written by Microsoft's security researchers
    b. A spam-only quarantine release interface
    c. A mobile app management engine
    d. A password vault for administrators

    Answer: a. A curated library of threat intelligence reports written by Microsoft's security researchers.

    Explanation: This is the exact description given in the documentation.

62. Which information does each Threat Analytics report include? **(Select all that apply)**

    a. Detailed descriptions of attacker behavior
    b. Mappings to the MITRE ATT&CK framework
    c. Recommended remediation steps
    d. Employee performance ratings

    Answer: a, b, c.

    Explanation: These are the structured report elements explicitly listed in the documentation.

63. Threat Analytics is integrated with which portal?

    a. Microsoft Defender XDR portal
    b. Azure Cost Management portal
    c. Microsoft Store portal
    d. Windows Update portal

    Answer: a. Microsoft Defender XDR portal.

    Explanation: Threat Analytics is integrated with the Microsoft Defender XDR portal for incident investigations.

64. Scenario: An alert is triggered for a specific vulnerability. According to the documentation, what can admins do with Threat Analytics?

    a. Consult the corresponding report to understand the threat, assess exposure, and implement recommended mitigations
    b. Disable Threat Explorer and rely only on user reports
    c. Convert the alert into a transport rule automatically
    d. Remove all external senders from Exchange Online

    Answer: a. Consult the corresponding report to understand the threat, assess exposure, and implement recommended mitigations.

    Explanation: This is the exact workflow described in the Threat Analytics section.

1.4

Explore Identity and Authentication in Microsoft 365

Abbreviation	Full Form
SSO	Single sign-on
TOTP	Time-based one-time passcodes
FIDO2	Fast IDentity Online 2
NFC	Near Field Communication
CBA	Certificate-based authentication
MFA	Multifactor Authentication
SSPR	Self-Service Password Reset
PHS	Password hash synchronization
PTA	Pass-through authentication
AD FS	Active Directory Federation Services
PIN	Personal Identification Number
ID	Identity

1. It's critical that administrators understand which foundational concepts in Microsoft 365? **(Select all that apply)**

   a. Identity

   b. Authentication

   c. Single sign-on

   d. Printer queue management

   Answer: a, b, c.

   Explanation: these core components form the backbone of how access is granted and secured across Microsoft cloud services.

2. Identity and authentication answer which two essential questions?

   Answer: Who is this person, device, or service trying to access Microsoft 365? How do we prove they are who they say they are?

   Explanation: identity and authentication through these two essential questions.

3. Every interaction with Microsoft 365 starts with verifying the identity of the user or device. **(True/False)**

   Answer: True.

   Explanation: every interaction, such as accessing email, joining Teams, or opening SharePoint documents, starts with identity verification.

4. Which service handles this identity verification process in Microsoft 365?

   a. Microsoft Entra ID

   b. Microsoft Purview

   c. Microsoft Intune

   d. Microsoft Sentinel

   Answer: a. Microsoft Entra ID.

   Explanation: that Microsoft Entra ID manages digital identities and ensures only trusted individuals and devices can access resources.

5. What role does SSO play once users are authenticated?

   a. It allows users to sign in once and access multiple Microsoft 365 services without re-entering credentials
   b. It replaces authorization policies entirely
   c. It blocks all non-Microsoft applications
   d. It disables tokens after every page load

   Answer: a. It allows users to sign in once and access multiple Microsoft 365 services without re-entering credentials.

   Explanation: SSO improves productivity and satisfaction while reducing the attack surface for credential theft.

6. What does identity refer to in Microsoft 365?

   a. The digital representation of a user, device, or service that needs to access Microsoft 365 apps and resources
   b. Only a user's password
   c. Only a physical smart card
   d. A transport rule for email routing

   Answer: a. The digital representation of a user, device, or service that needs to access Microsoft 365 apps and resources.

   Explanation: This is the exact definition given in the documentation.

7. The most common type of identity in Microsoft 365 is a user identity, which is a unique account that represents a real person within your organization. **(True/False)**

   Answer: True.

   Explanation: this when defining identity.

8. An identity typically includes which elements? **(Select all that apply)**

   a. A username
   b. A password or other sign-in method
   c. Attributes, such as job title, department, or group memberships
   d. Permissions that determine what they can access or do

   Answer: a, b, c, d.

   Explanation: All four are listed in the documentation as parts of a typical identity.

9. Which example is given for a username?

   a. jane.doe@contoso.com
   b. admin.local
   c. workstation-42
   d. support-ticket-15

   Answer: a. jane.doe@contoso.com.

   Explanation: this email address as the example of a username.

10. Microsoft 365 identities can be which two types?

    Answer: Cloud-only and Hybrid.

    Explanation: separates identities into cloud-only and hybrid types.

11. Cloud-only identities are created and managed entirely within Microsoft Entra ID, with no dependency on on-premises infrastructure. **(True/False)**

    Answer: True.

    Explanation: This definition is stated directly in the documentation.

12. Hybrid identities originate from where?

    a. An on-premises Active Directory and are synchronized to Microsoft Entra ID
    b. Microsoft Teams only
    c. Microsoft Defender XDR only
    d. SharePoint Online only

    Answer: a. An on-premises Active Directory and are synchronized to Microsoft Entra ID.

    Explanation: hybrid identities originate from on-premises Active Directory and are synchronized to Entra ID.

13. Which tools are specifically mentioned for synchronizing hybrid identities? **(Select all that apply)**

    a. Microsoft Entra Connect Sync
    b. Microsoft Entra Connect Cloud Sync
    c. Microsoft Authenticator only
    d. Outlook Mobile Sync

    Answer: a, b.

    Explanation: These are the tools named in the hybrid identity section.

14. Once a user's identity is authenticated, Microsoft Entra ID determines what that user is authorized to do based on which factors? **(Select all that apply)**

    a. Roles
    b. Group memberships
    c. Policies
    d. Desktop wallpaper settings

    Answer: a, b, c.

    Explanation: authorization is based on roles, group memberships, and policies.

15. Authentication in Microsoft 365 is the process of verifying a user's identity before granting access to Microsoft 365 services. **(True/False)**

    Answer: True.

    Explanation: This is the exact definition provided in the authentication section.

16. While passwords are still supported, organizations are increasingly adopting stronger, phishing-resistant authentication options that provide better security and user experience. **(True/False)**

    Answer: True.

    Explanation: this directly before listing passwordless and secure sign-in methods.

17. Which sign-in methods are specifically listed under passwordless and secure sign-in methods? **(Select all that apply)**

    a. Microsoft Authenticator
    b. FIDO2 security keys
    c. Windows Hello biometrics
    d. Certificate-based authentication

    Answer: a, b, c, d.

    Explanation: These four methods are explicitly named in the documentation.

18. Microsoft Authenticator supports which authentication experiences? **(Select all that apply)**

    a. Two-factor authentication through TOTP
    b. Two-factor authentication through push notifications

c. Passwordless sign-in

d. Only legacy authentication

Answer: a, b, c.

Explanation: Microsoft Authenticator supports TOTP, push notifications, and passwordless sign-in.

19. Scenario: After a user enters their username in Microsoft 365, they receive a push notification on their phone and verify using their fingerprint. What is notable about this sign-in?

    a. No password is entered

    b. A password must still be typed twice

    c. Only a smart card can complete the sign-in

    d. The sign-in works only on public kiosks

    Answer: a. No password is entered.

    Explanation: this example to describe passwordless sign-in with Microsoft Authenticator.

20. FIDO2 security keys use what to securely prove a user's identity without transmitting a password?

    a. Public-key cryptography

    b. Shared password vaults

    c. SMTP relay validation

    d. Only one-time passwords sent by email

    Answer: a. Public-key cryptography.

    Explanation: FIDO2 security keys use public-key cryptography.

21. Scenario: A user signs into Microsoft 365 on a public kiosk using a FIDO2 USB key. What benefit does the documentation highlight?

    a. No password is entered, and no credentials are exposed to the web browser

    b. The kiosk becomes domain joined automatically

    c. The user receives global admin permissions

    d. The session bypasses identity verification

    Answer: a. No password is entered, and no credentials are exposed to the web browser.

    Explanation: This is the exact scenario and benefit described in the documentation.

22. Windows Hello offers multifactor authentication by combining what? **(Select all that apply)**

    a. Something the user has (the device)

    b. Something the user is (biometric data)

    c. Something the user knows about transport rules

    d. Something the user memorizes about SharePoint sites only

    Answer: a, b.

    Explanation: Windows Hello combines the device with biometric data.

23. Certificate-based authentication (CBA) completes authentication by verifying possession of what?

    a. The certificate's private key, often paired with PIN entry

    b. A mailbox delegation rule

    c. A SharePoint sensitivity label

    d. An Outlook profile name

Answer: a. The certificate's private key, often paired with PIN entry.

Explanation: This is the precise CBA mechanism described in the documentation.

24. Which enhanced authentication features are listed in Microsoft Entra ID? **(Select all that apply)**

    a. Multifactor Authentication
    b. Self-Service Password Reset
    c. Microsoft Entra Identity Protection
    d. Transport rules

    Answer: a, b, c.

    Explanation: These three features are named in the enhanced authentication features section.

25. MFA requires users to provide two or more forms of verification before granting access. **(True/False)**

    Answer: True.

    Explanation: MFA drastically reduces the risk of account compromise, even if a password is stolen.

26. Which combinations are given as MFA examples? **(Select all that apply)**

    a. A password plus an Authenticator push notification
    b. A biometric scan followed by a security prompt
    c. A shared mailbox plus a transport rule
    d. A DLP label plus an Outlook category

    Answer: a, b.

    Explanation: These are the examples listed for MFA combinations in the documentation.

27. Scenario: A user accesses sensitive company files from a new device. What additional step might occur?

    a. The user is prompted to verify their identity with Microsoft Authenticator in addition to entering their password
    b. The user is granted permanent trusted status automatically
    c. MFA is disabled to reduce friction
    d. The device is enrolled in Intune without consent

    Answer: a. The user is prompted to verify their identity with Microsoft Authenticator in addition to entering their password.

    Explanation: this example to illustrate MFA for sensitive access from a new device.

28. What is the purpose of Self-Service Password Reset (SSPR)?

    a. To allow users to securely reset their own passwords without contacting the helpdesk
    b. To eliminate all authentication methods except passwords
    c. To permanently remove MFA requirements
    d. To synchronize Outlook signatures across devices

    Answer: a. To allow users to securely reset their own passwords without contacting the helpdesk.

    Explanation: SSPR saves time and reduces support costs by letting users reset their own passwords securely.

29. SSPR requires users to register one or more authentication methods and verifies their identity before allowing a reset. **(True/False)**

    Answer: True.

    Explanation: examples such as a phone number or the Authenticator app as registered methods.

30. Microsoft Entra Identity Protection uses machine learning to detect which kinds of behavior? **(Select all that apply)**

a. Risky sign-ins
b. User behavior such as sign-ins from unfamiliar locations
c. User behavior such as sign-ins from unfamiliar devices
d. Printer toner levels

Answer: a, b, c.

Explanation: These are the kinds of risky behavior specifically named in the documentation.

31. Scenario: A sign-in attempt from an unusual location triggers Identity Protection. What can the system do?

    a. Require extra verification steps, block access, or flag the activity for review
    b. Automatically remove the user from all groups permanently
    c. Disable all SSO sessions for the tenant
    d. Convert the attempt into a mail flow rule

    Answer: a. Require extra verification steps, block access, or flag the activity for review.

    Explanation: These are the exact outcomes described in the Identity Protection section.

32. Organizations can customize and enforce authentication policies within Microsoft Entra ID to do which of the following? **(Select all that apply)**

    a. Require MFA for all users or only for high-risk scenarios
    b. Specify approved sign-in methods
    c. Block outdated or insecure sign-in protocols such as legacy authentication
    d. Monitor authentication activity for risk and compliance

    Answer: a, b, c, d.

    Explanation: All four administrator actions are explicitly listed in the documentation.

33. In a hybrid identity setup, which cloud authentication methods are offered to validate users? **(Select all that apply)**

    a. Password hash synchronization
    b. Pass-through authentication
    c. Federation authentication
    d. Only local smart card authentication

    Answer: a, b, c.

    Explanation: These are the three hybrid authentication methods named in the documentation.

34. Which statement best describes Password hash synchronization (PHS)?

    a. The user's password hash is securely synced from on-premises Active Directory to Microsoft Entra ID, and credentials are validated in the cloud
    b. User passwords are stored in plain text in the cloud
    c. Every sign-in must contact the on-premises environment in real time
    d. Authentication is delegated only to AD FS

    Answer: a. The user's password hash is securely synced from on-premises Active Directory to Microsoft Entra ID, and credentials are validated in the cloud.

    Explanation: This is the exact description given for PHS.

35. PHS is simple to set up, highly resilient, and supports modern cloud-only features like Identity Protection and smart lockout. **(True/False)**

    Answer: True.

    Explanation: specifically highlights these advantages and says PHS is the most commonly recommended method for hybrid deployments in most cases.

36. Which statement best describes Pass-through authentication (PTA)?

    a. Microsoft Entra ID validates user passwords directly against on-premises Active Directory through a secure authentication agent
    b. Password hashes are always stored in the cloud
    c. No on-premises agent is required
    d. It disables real-time validation

    Answer: a. Microsoft Entra ID validates user passwords directly against on-premises Active Directory through a secure authentication agent.

    Explanation: PTA uses an encrypted request queue and an on-premises authentication agent to validate credentials in real time.

37. PTA is ideal for organizations that must authenticate users against their on-premises directory or have compliance requirements prohibiting password hashes from being stored in the cloud. **(True/False)**

    Answer: True.

    Explanation: This is the exact reason given for choosing PTA.

38. Which statement best describes federation authentication?

    a. Authentication is delegated to an external identity provider such as AD FS instead of Microsoft Entra ID handling sign-in directly
    b. It is the simplest and most resilient option for most organizations
    c. It requires no additional infrastructure
    d. It stores passwords only in Exchange Online

    Answer: a. Authentication is delegated to an external identity provider such as AD FS instead of Microsoft Entra ID handling sign-in directly.

    Explanation: federation redirects users to an on-premises federation server, which issues a trusted token.

39. Why does Microsoft now recommend PHS or PTA for most organizations instead of federation? **(Select all that apply)**

    a. They are simpler
    b. They are more resilient
    c. They are better integrated with cloud-only security features like Conditional Access and Identity Protection
    d. They require more infrastructure to maintain than federation

    Answer: a, b, c.

    Explanation: explicitly gives these reasons and says federation requires more infrastructure to maintain.

40. Both PHS and PTA are configured through which tools? **(Select all that apply)**

    a. Microsoft Entra Connect Sync
    b. Microsoft Entra Cloud Sync
    c. Microsoft Defender for Cloud Apps
    d. Microsoft Purview Compliance Manager

    Answer: a, b.

    Explanation: both PHS and PTA are configured through these synchronization tools.

41. SSO allows users to sign in once and gain access to all Microsoft 365 services and approved non-Microsoft apps without having to re-enter their credentials. **(True/False)**

    Answer: True.

    Explanation: This is the exact definition given in the Single sign-on in Microsoft 365 section.

42. Once users sign in, which services are explicitly listed as examples they can access with SSO? **(Select all that apply)**

    a. Outlook
    b. SharePoint
    c. Teams
    d. OneDrive
    e. Yammer
    f. Salesforce
    g. Adobe
    h. ServiceNow

    Answer: a, b, c, d, e, f, g, h.

    Explanation: All of these services are explicitly named in the documentation as examples of SSO access across Microsoft and non-Microsoft apps.

43. Behind the scenes, Microsoft Entra ID issues what that can be reused across sessions and services?

    a. A token
    b. A static password file
    c. A transport rule
    d. A DLP incident report

    Answer: a. A token.

    Explanation: Microsoft Entra ID issues a token that can be reused across sessions and services.

44. The tokens used in SSO are described as temporary digital passes that prove who the user is and last only for a short time. **(True/False)**

    Answer: True.

    Explanation: tokens in exactly these terms to show how SSO remains secure.

45. SSO can be implemented in which environments?

    Answer: Cloud-only and hybrid environments.

    Explanation: SSO can be implemented in both cloud-only and hybrid setups.

46. In a cloud-only setup, authentication and token issuance happen entirely in the cloud. **(True/False)**

    Answer: True.

    Explanation: this simplifies the environment by removing the need to maintain local infrastructure.

47. Which organizations are said to commonly use a cloud-only SSO approach?

    a. Small to mid-sized businesses, startups, and organizations adopting a cloud-first IT strategy
    b. Only government agencies with air-gapped networks
    c. Only organizations running AD FS
    d. Only companies with no Microsoft 365 licenses

    Answer: a. Small to mid-sized businesses, startups, and organizations adopting a cloud-first IT strategy.

    Explanation: these organizations specifically.

48. Why do companies often maintain a hybrid environment? **(Select all that apply)**

    a. They have existing on-premises systems or applications that can't easily move to the cloud
    b. Regulatory requirements
    c. Security requirements

d. Operational requirements

Answer: a, b, c, d.

Explanation: all four of these reasons for maintaining a hybrid environment.

49. In a hybrid setup, identities are synchronized from on-premises Active Directory to Microsoft Entra ID in the cloud using which tools? **(Select all that apply)**

    a. Microsoft Entra Connect Sync

    b. Microsoft Entra Cloud Sync

    c. Microsoft Sentinel

    d. Defender for Office 365

    Answer: a, b.

    Explanation: These are the two tools named in the hybrid SSO section.

50. On Windows devices joined to Microsoft Entra ID or hybrid-joined to on-premises Active Directory, SSO is enabled by default through what?

    a. Windows Integrated Authentication

    b. Outlook cached mode

    c. Safe Links

    d. Conditional Access templates

    Answer: a. Windows Integrated Authentication.

    Explanation: explicitly states this in the SSO and device-based access section.

51. Scenario: Jane signs into her Microsoft Entra ID–joined laptop using Windows Hello. When she opens Outlook, Teams, or OneDrive, what happens?

    a. She isn't asked to sign in again

    b. She must re-enter her password for every app

    c. Only Outlook opens without another sign-in

    d. SSO works only for browser apps, not desktop apps

    Answer: a. She isn't asked to sign in again.

    Explanation: Jane's scenario to explain token-based SSO across Microsoft 365 services.

52. When SSO is combined with Conditional Access and MFA, it provides what kind of experience?

    a. A secure and seamless identity experience across environments

    b. A password-only sign-in experience

    c. An experience limited to on-premises resources only

    d. An experience with no token expiration

    Answer: a. A secure and seamless identity experience across environments.

    Explanation: ends by saying that combining SSO with Conditional Access and MFA provides a secure and seamless identity experience across environments.

1.5

Manage Access and Permissions in Microsoft 365

Abbreviation	Full Form
RBAC	Role-based access control
PIM	Privileged Identity Management
UPN	User Principal Name
API	Application Programming Interface
HR	Human Resources
MFA	Multifactor Authentication

1. Once a user's identity is verified through authentication, what is the next crucial question?

   a. What device are they using?

   b. What are they allowed to do?

   c. What browser are they using?

   d. What region are they in?

   Answer: b. What are they allowed to do?

   Explanation: opens this section by saying that after identity is verified, the next crucial question is what the user is allowed to do.

2. Authorization in Microsoft 365 is the process of granting or restricting access to resources like email, files, apps, and administrative settings. **(True/False)**

   Answer: True.

   Explanation: This is the exact definition used in the documentation.

3. Effective authorization ensures that users have access only to what?

   a. All tenant resources for convenience

   b. Only the tools and data they need to do their job

   c. Only email and nothing else

   d. Only Teams and SharePoint by default

   Answer: b. Only the tools and data they need to do their job.

   Explanation: summarizes effective authorization as giving users what they need for their job—nothing more, nothing less.

4. Microsoft 365 offers what kind of approach to managing access and permissions?

   a. A fixed and inflexible approach

   b. A layered and flexible approach

   c. A device-only approach

   d. An email-only approach

   Answer: b. A layered and flexible approach.

   Explanation: explicitly describes access and permissions in Microsoft 365 as layered and flexible.

5. Which are examples of roles that grant broad capabilities across the tenant? **(Select all that apply)**

a. Global Administrator
b. Teams Administrator
c. Visitor
d. Member

Answer: a, b.

Explanation: contrasts tenant-wide administrative roles like Global Administrator and Teams Administrator with resource-specific permissions like Visitor and Member.

6. Which are examples of resource-specific permissions in the documentation? **(Select all that apply)**

   a. Read-only access to a single SharePoint document
   b. Editing rights to a Teams channel
   c. Full control over all Microsoft 365 settings and services
   d. View access to a specific SharePoint site

   Answer: a, b, d.

   Explanation: read-only access to a SharePoint document and editing rights to a Teams channel as examples of resource-specific permissions; view access is also aligned with the SharePoint Visitor example.

7. Conditional Access policies can be used to apply access restrictions based on which factors? **(Select all that apply)**

   a. Device compliance
   b. Sign-in location
   c. Risk level
   d. App sensitivity

   Answer: a, b, c, d.

   Explanation: All four are explicitly listed in the opening section of the documentation.

8. To simplify permission management, Microsoft 365 uses which security objects?

   a. Users and groups
   b. Only mailboxes and calendars
   c. Only transport rules and policies
   d. Only devices and tokens

   Answer: a. Users and groups.

   Explanation: Microsoft 365 uses security objects such as users and groups to simplify permission management.

9. There are several types of groups available in Microsoft 365, each with its own purpose and behavior. **(True/False)**

   Answer: True.

   Explanation: security groups, Microsoft 365 groups, mail-enabled groups, and dynamic groups as examples.

10. After authentication confirms a user's identity, authorization in Microsoft 365 controls access based on which elements? **(Select all that apply)**

    a. Assigned roles
    b. Permissions
    c. Group memberships
    d. Resource-specific settings

    Answer: a, b, c, d.

    Explanation: These are the authorization factors explicitly listed in the documentation.

11. Microsoft 365 uses which central mechanism for authorization?

    a. Role-based access control
    b. Safe Links
    c. Threat Explorer
    d. Windows Integrated Authentication

    Answer: a. Role-based access control.

    Explanation: The Role-based access control section says Microsoft 365 uses RBAC as a central mechanism for authorization.

12. With RBAC, users are assigned to roles that grant which kinds of rights?

    a. Specific administrative or functional rights
    b. Unlimited rights to all resources by default
    c. Only device compliance rights
    d. Only mail flow permissions

    Answer: a. Specific administrative or functional rights.

    Explanation: users are assigned to roles that grant specific administrative or functional rights.

13. Which statement about Microsoft 365 roles is correct?

    a. All roles have identical permissions
    b. Roles are built into Microsoft Entra ID and are service-specific
    c. Roles can only be assigned to devices
    d. Roles can't be customized

    Answer: b. Roles are built into Microsoft Entra ID and are service-specific.

    Explanation: explicitly states this and later notes that custom roles can also be created.

14. Which administrative roles are specifically listed? **(Select all that apply)**

    a. Global Administrator
    b. Exchange Administrator
    c. SharePoint Administrator
    d. Teams Administrator
    e. User Administrator

    Answer: a, b, c, d, e.

    Explanation: All five are named in the RBAC section.

15. The Global Administrator role grants full control over all Microsoft 365 settings and services and is typically limited to a few trusted individuals. **(True/False)**

    Answer: True.

    Explanation: This statement follows the exact wording in the documentation.

16. Microsoft 365 supports custom roles for more fine-tuned access control. **(True/False)**

    Answer: True.

    Explanation: administrators can also create custom roles.

17. For non-administrative users, most access in Microsoft 365 is assigned through what? **(Select all that apply)**

    a. Group-based permissions
    b. Resource-specific access controls

c. Global administrator assignment

d. Tenant-wide security defaults only

Answer: a, b.

Explanation: most non-administrative access is assigned through group-based permissions or resource-specific access controls.

18. Adding a user to a Microsoft 365 Group grants them access to which shared resources? **(Select all that apply)**

    a. A shared mailbox in Outlook

    b. A calendar

    c. A SharePoint site

    d. A Planner board

    Answer: a, b, c, d.

    Explanation: These resources are all listed in the group-based permissions example.

19. Permissions granted through Microsoft 365 Groups are tied to global administrative roles like SharePoint Administrator. **(True/False)**

    Answer: False.

    Explanation: these permissions aren't tied to global administrative roles, but to specific resources.

20. Which SharePoint built-in roles are explicitly listed? **(Select all that apply)**

    a. Visitor

    b. Member

    c. Owner

    d. Global Reader

    Answer: a, b, c.

    Explanation: Visitor, Member, and Owner as SharePoint built-in roles.

21. Match the SharePoint built-in role to its access level.

Column A	**Column B**
1. Visitor	a. Full control
2. Member	b. Read-only
3. Owner	c. Edit

    Answer: 1-b, 2-c, 3-a.

    Explanation: explicitly maps Visitor to read-only, Member to edit, and Owner to full control.

22. Scenario: Sarah is part of the "Marketing Team" Microsoft 365 Group. What does her group membership give her access to?

    a. A team SharePoint site with editable content and a shared calendar

    b. Full tenant-wide administrative privileges

    c. Permanent access to every SharePoint site in the organization

    d. Exchange transport rule management

    Answer: a. A team SharePoint site with editable content and a shared calendar.

    Explanation: This is the exact example used in the documentation.

23. Scenario: Sarah is temporarily added to another SharePoint site called "Event Planning" as a Visitor. What does this allow her to do?

a. View documents on that site, but not edit or upload new content
b. Edit all files in the library
c. Manage site membership and settings
d. Change tenant-wide policies

Answer: a. View documents on that site, but not edit or upload new content.

Explanation: this exact scenario to illustrate resource-specific permissions.

24. Which advanced authorization features are explicitly discussed? **(Select all that apply)**

a. Conditional Access
b. Privileged Identity Management
c. Access Packages
d. Information protection and sensitivity labels

Answer: a, b, c, d.

Explanation: These four features are listed under Advanced authorization scenarios.

25. Conditional Access is described as one of the most powerful authorization tools because it dynamically applies access rules based on which factors? **(Select all that apply)**

a. Sign-in risk
b. Device compliance
c. User location
d. Sensitivity of the app or data being accessed

Answer: a, b, c, d.

Explanation: All four are explicitly listed in the Conditional Access paragraph.

26. Scenario: Which Conditional Access rule is explicitly described in the documentation?

a. Require MFA when users access financial data from a personal device
b. Automatically make all guest users site owners
c. Disable Teams for compliant devices
d. Grant all users access to SharePoint from any location

Answer: a. Require MFA when users access financial data from a personal device.

Explanation: this as an example of context-aware Conditional Access.

27. PIM limits how long a user can hold elevated permissions, reducing the risk of misuse or attack. **(True/False)**

Answer: True.

Explanation: PIM enables just-in-time access and automatically removes elevated access when the time window ends.

28. Scenario: An IT admin needs Exchange Administrator rights for a specific task. What feature can require them to request access and remove it after the approved time window ends?

a. Privileged Identity Management
b. Microsoft 365 Group membership
c. Distribution group ownership
d. Mail flow rules

Answer: a. Privileged Identity Management.

Explanation: This is the exact example given in the PIM section.

29. Access Packages are especially useful for which scenario?

a. Bundling permissions across multiple resources with workflows and approval steps
b. Replacing SharePoint libraries entirely
c. Blocking all guest access automatically
d. Managing only email distribution lists

Answer: a. Bundling permissions across multiple resources with workflows and approval steps.

Explanation: Access Packages are useful for onboarding employees or external collaborators needing timed access.

30. Information protection and sensitivity labels restrict which actions even after access is granted? **(Select all that apply)**

a. Printing
b. Copying
c. Forwarding
d. Powering off the device

Answer: a, b, c.

Explanation: These are the exact actions listed in the documentation.

31. These advanced authorization features allow organizations to move beyond simple "allow or deny" decisions and implement which kinds of controls? **(Select all that apply)**

a. Context-aware access controls
b. Time-limited access controls
c. Data-sensitive access controls
d. Unauthenticated access controls

Answer: a, b, c.

Explanation: these exact phrases when describing advanced authorization aligned with Zero Trust principles.

32. In Microsoft 365, users and groups are the core security objects used to manage access to apps, services, and data. **(True/False)**

Answer: True.

Explanation: This is the opening statement of the Users and groups section.

33. A user in Microsoft Entra ID represents what?

a. An individual identity
b. Only a shared mailbox
c. Only a guest invitation token
d. Only a Teams channel membership

Answer: a. An individual identity.

Explanation: a user in Microsoft Entra ID represents an individual identity.

34. Which types of users are explicitly listed? **(Select all that apply)**

a. Internal employees
b. External collaborators (guests)
c. Service accounts for automation
d. System-generated accounts for applications

Answer: a, b, c, d.

Explanation: All four user types are explicitly named in the documentation.

35. Which user properties can be used to organize or automate user management? **(Select all that apply)**

    a. Job title
    b. Department
    c. Office location
    d. Manager

    Answer: a, b, c, d.

    Explanation: These are the properties listed in the Users paragraph.

36. What is the purpose of groups in Microsoft 365?

    a. To provide a scalable way to assign access and permissions
    b. To replace all identities with shared accounts
    c. To disable onboarding and offboarding processes
    d. To eliminate the need for policies

    Answer: a. To provide a scalable way to assign access and permissions.

    Explanation: groups improve consistency and make onboarding/offboarding more efficient.

37. Which group types are explicitly described in the documentation? **(Select all that apply)**

    a. Security groups
    b. Microsoft 365 groups
    c. Mail-Enabled Security groups
    d. Distribution groups
    e. Dynamic groups

    Answer: a, b, c, d, e.

    Explanation: All five are described in separate paragraphs.

38. Security groups are focused only on controlling access and don't create shared tools like mailboxes or file storage. **(True/False)**

    Answer: True.

    Explanation: contrasts Security groups with Microsoft 365 groups by stating they don't create shared tools.

39. Which example is given for a Security group?

    a. Finance Read Only
    b. Company Announcements
    c. Marketing Team
    d. Product Launch Q1

    Answer: a. Finance Read Only.

    Explanation: "Finance Read Only" as the example of a security group used for view access.

40. When you create a Microsoft 365 Group, which resources are automatically set up? **(Select all that apply)**

    a. A shared mailbox in Outlook
    b. A group calendar
    c. A SharePoint document library for file sharing
    d. A Planner board for task management
    e. An optional connected Microsoft Teams workspace

Answer: a, b, c, d, e.

Explanation: All five are explicitly listed under Microsoft 365 groups.

41. Scenario: A "Marketing Team" Microsoft 365 group is created. Which linked resources are named in the documentation? **(Select all that apply)**

    a. A shared Outlook mailbox
    b. A calendar for campaign planning
    c. A SharePoint site for storing marketing assets
    d. A Planner board to track tasks
    e. A connected Team in Microsoft Teams

    Answer: a, b, c, d, e.

    Explanation: These are the exact resources listed in the "Marketing Team" example.

42. Mail-Enabled Security groups function like Security groups, but they can also be used as what?

    a. Email distribution lists
    b. Conditional Access templates
    c. Sensitivity labels
    d. Device compliance policies

    Answer: a. Email distribution lists.

    Explanation: these groups can both control access and receive email like a distribution list.

43. Which example is given for a Mail-Enabled Security group?

    a. Finance Managers
    b. Company Announcements
    c. Marketing Team
    d. Sales Department Dynamic Group

    Answer: a. Finance Managers.

    Explanation: "Finance Managers" as the example of a group that both has edit access and receives monthly updates by email.

44. Distribution groups can be used to assign permissions to Microsoft 365 resources. **(True/False)**

    Answer: False.

    Explanation: Distribution groups are designed purely for sending messages and can't be used to assign permissions.

45. Which example is given for a Distribution group?

    a. Company Announcements
    b. Finance Managers
    c. Marketing Team
    d. Finance Read Only

    Answer: a. Company Announcements.

    Explanation: HR might use a "Company Announcements" distribution group to send all-staff updates.

46. Dynamic groups are automatically populated based on what? **(Select all that apply)**

    a. Department
    b. Location
    c. Job title

d. Other properties stored in Microsoft Entra ID

Answer: a, b, c, d.

Explanation: These are the user attributes explicitly listed for dynamic group membership.

47. You can manually add or remove individual users from a Dynamic group. **(True/False)**

Answer: False.

Explanation: dynamic membership is based only on user attributes and can't be managed manually per user.

48. Dynamic groups can be created as which types? **(Select all that apply)**

a. Security groups
b. Microsoft 365 groups
c. Distribution groups only
d. Mail-Enabled Security groups only

Answer: a, b.

Explanation: dynamic groups can be created as either Security groups or Microsoft 365 groups.

49. Scenario: You create a dynamic group that includes all users where "Department = Sales." What happens when a user's Department field changes?

a. Microsoft Entra ID automatically adds or removes the user from the group
b. An admin must manually review every change first
c. The user remains permanently in the original group
d. Only the user can update their own group membership

Answer: a. Microsoft Entra ID automatically adds or removes the user from the group.

Explanation: This is the exact dynamic group example used in the documentation.

50. Which tools are specifically mentioned for managing users and groups? **(Select all that apply)**

a. Microsoft 365 admin center
b. Microsoft Entra admin center
c. PowerShell
d. Microsoft Graph API

Answer: a, b, c, d.

Explanation: These are the four tools listed in the Group administration section.

51. The Microsoft 365 admin center is ideal for which kinds of tasks?

a. Day-to-day group tasks such as creating groups, adding or removing members, or adjusting settings
b. Advanced nation-state threat hunting
c. Endpoint isolation and remediation
d. Dark web credential monitoring

Answer: a. Day-to-day group tasks such as creating groups, adding or removing members, or adjusting settings.

Explanation: the Microsoft 365 admin center as a user-friendly tool for basic administrative tasks.

52. The Microsoft Entra admin center provides more granular control for which activities? **(Select all that apply)**

a. Configuring group membership rules for Dynamic Groups
b. Enforcing Conditional Access policies tied to group membership
c. Viewing audit logs
d. Viewing sign-in activity to monitor group-based access behavior

Answer: a, b, c, d.

Explanation: All four are explicitly listed in the Microsoft Entra admin center paragraph.

53. In enterprise scenarios where changes happen at scale or need to be automated, which tools become essential? **(Select all that apply)**

    a. PowerShell
    b. Microsoft Graph API
    c. Microsoft Viva Learning
    d. SharePoint Visitor role

    Answer: a, b.

    Explanation: PowerShell and Microsoft Graph API become essential in enterprise scenarios requiring automation at scale.

54. Scenario: Which example is given for automation with Microsoft Graph?

    a. Automatically updating project teams in Microsoft 365 based on changes in a Human Resources database
    b. Automatically approving all external sharing requests
    c. Automatically converting distribution groups into Teams workspaces
    d. Automatically making all users Global Administrators during onboarding

    Answer: a. Automatically updating project teams in Microsoft 365 based on changes in a Human Resources database.

    Explanation: this as the Microsoft Graph automation example.

55. Proper use of groups helps maintain security and compliance because access can be controlled at scale instead of assigning permissions to users individually. **(True/False)**

    Answer: True.

    Explanation: that assigning permissions individually can lead to inconsistencies and gaps, while groups reduce administrative overhead and improve security.

56. According to the documentation, organizations should align group membership with which structures? **(Select all that apply)**

    a. Business roles
    b. Departments
    c. Projects
    d. Random mailbox sizes

    Answer: a, b, c.

    Explanation: The best-practice section explicitly recommends aligning group membership with business roles, departments, or projects.

57. Which examples are given as best-practice group structures? **(Select all that apply)**

    a. Departmental groups like "Finance Team" or "HR Staff"
    b. Project-based groups like "Product Launch Q1"
    c. Dynamic groups where the "Department" attribute equals "Sales"
    d. Tenant-wide groups for every printer driver

    Answer: a, b, c.

    Explanation: These are the three explicit examples provided in the final best-practice section.

58. Which statement best summarizes the outcome of thoughtful group planning in Microsoft 365?

a. It helps build a secure, scalable, and easy-to-manage access model
b. It eliminates the need for authorization completely
c. It guarantees every user full collaboration rights
d. It removes the need for Conditional Access and PIM

Answer: a. It helps build a secure, scalable, and easy-to-manage access model.

Explanation: concludes with this exact benefit of clean group structures and up-to-date memberships.

1.6

Explore Identity and Access Management in Microsoft Entra

Abbreviation	Full Form
IAM	Identity and access management
SSO	Single sign-on
MFA	Multifactor authentication
PIM	Privileged Identity Management
AWS	Amazon Web Services
VPN	Virtual Private Network
IP	Internet Protocol
SaaS	Software as a Service
B2B	Business-to-business
PC	Personal computer

1. This unit focuses on which Microsoft Entra capabilities? **(Select all that apply)**

   a. Conditional Access

   b. Identity Secure Score

   c. Privileged Identity Management

   d. Outlook transport rules

   Answer: a, b, c.

   Explanation: that this unit focuses on Conditional Access, Identity Secure Score, and Privileged Identity Management (PIM).

2. These tools form the backbone of which security model?

   a. Shared responsibility model

   b. Microsoft 365 Zero Trust security model

   c. Traditional perimeter model

   d. Endpoint-only protection model

   Answer: b. Microsoft 365 Zero Trust security model.

   Explanation: The introduction explicitly says these tools form the backbone of the Microsoft 365 Zero Trust security model.

3. Microsoft Entra is a suite of identity and access management solutions that help organizations securely manage which elements? **(Select all that apply)**

   a. Users

   b. Devices

   c. Permissions

   d. Only Exchange mail flow

   Answer: a, b, c.

   Explanation: Microsoft Entra helps manage users, devices, and permissions across Microsoft 365, Azure, and non-Microsoft applications.

4. Microsoft Entra ID is described as:

   a. A comprehensive identity platform that enables secure user authentication, single sign-on, group and role management, and app integration
   b. A mail filtering engine only
   c. A device compliance report only
   d. A transport rule service only

   Answer: a. A comprehensive identity platform that enables secure user authentication, single sign-on, group and role management, and app integration.

   Explanation: This is the exact description used in the feature list.

5. Which Microsoft Entra capability is described as being at the heart of the Zero Trust model?

   a. Identity Secure Score
   b. Conditional Access
   c. Verified ID
   d. Permissions Management

   Answer: b. Conditional Access.

   Explanation: Conditional Access is at the heart of the Zero Trust model.

6. Which Microsoft Entra feature is described as a built-in security analytics tool?

   a. Identity Secure Score
   b. Microsoft Entra Verified ID
   c. Microsoft Entra Internet Access
   d. Microsoft Entra Private Access

   Answer: a. Identity Secure Score.

   Explanation: Identity Secure Score as a built-in security analytics tool that measures and tracks identity security posture.

7. Which feature provides just-in-time privileged access to administrative roles in Microsoft Entra ID and Azure?

   a. Microsoft Entra ID Protection
   b. Privileged Identity Management
   c. Microsoft Entra Permissions Management
   d. Conditional Access

   Answer: b. Privileged Identity Management.

   Explanation: The feature list explicitly assigns just-in-time privileged access to PIM.

8. Which Microsoft Entra capability helps manage the user identity lifecycle, entitlement management, and access reviews?

   a. Microsoft Entra ID Governance
   b. Microsoft Entra Verified ID
   c. Microsoft Entra Private Access
   d. Identity Secure Score

   Answer: a. Microsoft Entra ID Governance.

   Explanation: Entra ID Governance provides automated lifecycle tools, entitlement management, and access reviews.

9. Microsoft Entra ID Protection uses machine learning and real-time telemetry from Microsoft's security graph to identify which risks? **(Select all that apply)**

a. Compromised accounts
b. Risky sign-ins
c. Unusual user behavior
d. Printer firmware drift

Answer: a, b, c.

Explanation: These are the three identity-based risks explicitly listed in the documentation.

10. Which Microsoft Entra service enables decentralized identity solutions by allowing organizations to issue, present, and verify digital credentials?

    a. Microsoft Entra Verified ID
    b. Microsoft Entra Internet Access
    c. Microsoft Entra Permissions Management
    d. Microsoft Entra ID Governance

    Answer: a. Microsoft Entra Verified ID.

    Explanation: This is the exact purpose assigned to Verified ID in the feature list.

11. Microsoft Entra Permissions Management helps organizations manage who has access to what across which cloud environments? **(Select all that apply)**

    a. Azure
    b. Amazon Web Services
    c. Google Cloud
    d. Only on-premises Active Directory

    Answer: a, b, c.

    Explanation: explicitly names Azure, AWS, and Google Cloud.

12. Microsoft Entra Internet Access and Entra Private Access are described as modern, cloud-based alternatives to what?

    a. Traditional VPNs and proxies
    b. Password managers
    c. Shared mailboxes
    d. Endpoint analytics tools

    Answer: a. Traditional VPNs and proxies.

    Explanation: this exact comparison when describing these services.

13. These Microsoft Entra services are designed to enforce which outcomes? **(Select all that apply)**

    a. Least privilege
    b. Reduced attack surface
    c. Secure access from any device, location, or network
    d. Permanent unrestricted admin access

    Answer: a, b, c.

    Explanation: These outcomes are listed at the end of the Microsoft Entra features section.

14. Conditional Access is a dynamic policy engine built into Microsoft Entra that evaluates signals in real time to decide whether to grant or restrict user access. **(True/False)**

    Answer: True.

    Explanation: This is the exact definition given at the start of the Conditional Access section.

15. Conditional Access policies are a cornerstone of Microsoft's Zero Trust model. **(True/False)**

    Answer: True.

    Explanation: this directly.

16. Which real-time signals are used by Conditional Access policies? **(Select all that apply)**

    a. User and sign-in risk
    b. Device state
    c. Application sensitivity
    d. Location and IP address
    e. Session context and behavior

    Answer: a, b, c, d, e.

    Explanation: All five signal categories are explicitly listed in the documentation.

17. User and sign-in risk can be assigned as which levels?

    a. Low, medium, high
    b. Green, yellow, red, blue
    c. Internal, external
    d. Bronze, silver, gold

    Answer: a. Low, medium, high.

    Explanation: explicitly names low, medium, and high as the risk levels.

18. Conditional Access evaluates device state by checking for which examples? **(Select all that apply)**

    a. Up-to-date antivirus
    b. Encryption enabled
    c. Managed through Microsoft Intune
    d. Whether the wallpaper is corporate branded

    Answer: a, b, c.

    Explanation: These are the examples given for device compliance and state.

19. Application sensitivity allows organizations to do what?

    a. Apply stricter policies for high-value or sensitive apps and lighter controls for low-risk services
    b. Remove MFA from financial systems
    c. Grant the same access controls to every app regardless of value
    d. Disable policy enforcement for guest access

    Answer: a. Apply stricter policies for high-value or sensitive apps and lighter controls for low-risk services.

    Explanation: this ensures security is proportionate to the resource's sensitivity.

20. Location and IP address can be used in Conditional Access to do which of the following? **(Select all that apply)**

    a. Deny access from high-risk locations
    b. Allow access only from known corporate networks
    c. Restrict access based on geographic regions
    d. Disable all session controls

    Answer: a, b, c.

    Explanation: These are the exact examples listed under location and IP address.

21. With integration into Microsoft Defender for Cloud Apps, Conditional Access policies can apply which session controls? **(Select all that apply)**

    a. Restrict downloading files
    b. Restrict copying data
    c. Monitor risky sessions
    d. Automatically create guest users

    Answer: a, b, c.

    Explanation: restricting downloads, restricting data copying, and using session context with Defender for Cloud Apps.

22. Require MFA for external access is a commonly used Conditional Access policy that enforces multifactor authentication for users accessing Microsoft 365 from outside the corporate network. **(True/False)**

    Answer: True.

    Explanation: This is the first commonly used Conditional Access policy example in the documentation.

23. Which Conditional Access policy example denies access to services like SharePoint and OneDrive unless the device is registered with Intune and meets compliance requirements?

    a. Block access from unmanaged devices
    b. Require MFA for external access
    c. Block legacy authentication
    d. Enforce Terms of Use acceptance before access

    Answer: a. Block access from unmanaged devices.

    Explanation: this policy using that exact name and outcome.

24. Which commonly used Conditional Access policy examples are explicitly listed? **(Select all that apply)**

    a. Require MFA for external access
    b. Block access from unmanaged devices
    c. Require sign-in risk mitigation for high-risk users
    d. Enforce Terms of Use acceptance before access
    e. Restrict access to specific applications for guest users
    f. Block legacy authentication
    g. Apply session controls with Microsoft Defender for Cloud Apps

    Answer: a, b, c, d, e, f, g.

    Explanation: These seven examples are all listed in the documentation under commonly used Conditional Access policies.

25. Which outdated protocols are specifically mentioned as examples of legacy authentication? **(Select all that apply)**

    a. POP3
    b. IMAP
    c. SMTP
    d. Kerberos

    Answer: a, b, c.

    Explanation: POP3, IMAP, and SMTP as examples of legacy authentication protocols.

26. Scenario: An organization secures its Windows 365 Cloud PC infrastructure with Conditional Access. Which requirements are explicitly listed? **(Select all that apply)**

a. Complete MFA for every sign-in
b. Use a compliant, Intune-managed device
c. Be located within approved geographic regions
d. Have a low user risk score

Answer: a, b, c, d.

Explanation: These are the exact requirements listed in the example scenario.

27. Which tool is used to simulate the impact of Conditional Access policies during rollout?

    a. What If tool
    b. Threat Explorer
    c. Secure Score trend graph
    d. Access Reviews dashboard

    Answer: a. What If tool.

    Explanation: IT administrators use the What If tool in the Microsoft Entra admin center to validate logic and avoid misconfigurations.

28. Identity Secure Score is best described as:

    a. A dashboard-based metric that provides a snapshot of an organization's identity security posture in Microsoft Entra ID
    b. A ticketing queue for password resets
    c. A mail hygiene engine for Exchange Online
    d. A device configuration baseline only

    Answer: a. A dashboard-based metric that provides a snapshot of an organization's identity security posture in Microsoft Entra ID.

    Explanation: This is the exact definition in the Identity Secure Score section.

29. Identity Secure Score helps security teams do which of the following? **(Select all that apply)**

    a. Track progress
    b. Prioritize actions
    c. Make data-driven decisions to reduce identity-related risk
    d. Replace all audit logs

    Answer: a, b, c.

    Explanation: These are the three outcomes listed in the documentation.

30. Which components of Identity Secure Score are explicitly described? **(Select all that apply)**

    a. Security recommendations
    b. Improvement actions
    c. Action status options
    d. Benchmarking tools

    Answer: a, b, c, d.

    Explanation: These four components are listed under Components of Identity Secure Score.

31. Security recommendations are curated suggestions from Microsoft designed to improve identity security and are continuously updated as Microsoft's threat intelligence evolves. **(True/False)**

    Answer: True.

    Explanation: recommendations are curated, prioritized, and continuously updated.

32. Which action status options are listed for Identity Secure Score? **(Select all that apply)**

    a. Completed
    b. Planned
    c. Resolved via Third Party
    d. Risk Accepted

    Answer: a, b, c, d.

    Explanation: These four status options are explicitly listed in the documentation.

33. Benchmarking tools in Identity Secure Score allow organizations to compare their current security posture against similar organizations by which factors? **(Select all that apply)**

    a. Industry
    b. Region
    c. Size
    d. Browser type

    Answer: a, b, c.

    Explanation: benchmarking can compare organizations by industry, region, or size.

34. Scenario: A company reviews its Identity Secure Score and finds that only 30% of users are registered for MFA, over 100 inactive user accounts remain, and legacy authentication is still allowed. Which actions does the IT team take? **(Select all that apply)**

    a. Roll out MFA to all users through a conditional access policy and user onboarding campaigns
    b. Disable or remove unused service accounts after verifying dependencies
    c. Block legacy authentication using a conditional access policy
    d. Grant all inactive accounts Global Administrator rights temporarily

    Answer: a, b, c.

    Explanation: These are the exact follow-up actions described in the example scenario.

35. According to the example scenario, these changes lead to what result?

    a. A 40-point increase in Secure Score
    b. A 4-point increase in Secure Score
    c. Immediate removal of all guest users
    d. Permanent disablement of Conditional Access

    Answer: a. A 40-point increase in Secure Score.

    Explanation: these changes lead to a 40-point increase in Secure Score.

36. PIM in Microsoft Entra enables just-in-time access to sensitive roles and resources. **(True/False)**

    Answer: True.

    Explanation: This is the opening statement of the PIM section.

37. Instead of assigning permanent admin rights, PIM allows users to do what? **(Select all that apply)**

    a. Activate roles temporarily
    b. Use optional approval
    c. Use MFA
    d. Provide a justification requirement

    Answer: a, b, c, d.

    Explanation: all four as part of the PIM model.

38. Why does PIM reduce the attack surface?

    a. By limiting the time and scope of elevated access
    b. By making every user a standing administrator
    c. By disabling audit logs
    d. By removing all approval workflows

    Answer: a. By limiting the time and scope of elevated access.

    Explanation: this approach reduces the attack surface.

39. Scenario: An Exchange Administrator elevates to the Global Administrator role only when performing critical tasks, and the Global Admin role then automatically deactivates after a set duration. Which Microsoft Entra capability does this illustrate?

    a. Privileged Identity Management
    b. Identity Secure Score
    c. Verified ID
    d. Permissions Management

    Answer: a. Privileged Identity Management.

    Explanation: this exact example to illustrate temporary elevation and automatic deactivation.

40. Which core capabilities of PIM are explicitly listed? **(Select all that apply)**

    a. Time-bound role activation
    b. MFA and justification requirements
    c. Approval workflow integration
    d. Access reviews and expiration policies
    e. Audit logging and alerting

    Answer: a, b, c, d, e.

    Explanation: All five are explicitly listed in the Core capabilities of PIM section.

41. Time-bound role activation means roles can be activated only for a specified period, just long enough to complete a task. **(True/False)**

    Answer: True.

    Explanation: This is the exact definition given in the PIM capabilities section.

42. When users request to activate a privileged role, PIM can require which safeguards? **(Select all that apply)**

    a. Multifactor authentication
    b. A business justification
    c. Approval from a reviewer
    d. Automatic guest access

    Answer: a, b, c.

    Explanation: PIM can require MFA, justification, and use approval workflows.

43. Which example is given for a business justification when activating a role?

    a. Updating virtual network peering configuration for data center migration
    b. Creating a new company logo
    c. Editing a shared Outlook signature
    d. Reviewing junk mail preferences

Answer: a. Updating virtual network peering configuration for data center migration.

Explanation: This is the exact justification provided in the example scenario.

44. PIM supports scheduled or ad-hoc access reviews for all eligible or active role assignments. **(True/False)**

    Answer: True.

    Explanation: access reviews help ensure users retain only the permissions they actually need.

45. Audit logs for PIM are accessible through which tools? **(Select all that apply)**

    a. Microsoft Entra admin center
    b. Microsoft Sentinel
    c. Microsoft 365 admin center only
    d. Outlook on the web

    Answer: a, b.

    Explanation: audit logs are accessible through the Microsoft Entra admin center and Microsoft Sentinel.

46. Alerts can be configured for sensitive PIM events such as activation of highly privileged roles like Global Administrator. **(True/False)**

    Answer: True.

    Explanation: explicitly gives Global Administrator activation as an example of a sensitive event that can generate alerts.

47. Scenario: A multinational technology company uses PIM to secure administrative access across Microsoft 365 and Azure. Which role is the engineer preassigned as eligible for?

    a. Network Contributor
    b. Security Reader
    c. Teams Administrator
    d. Billing Administrator

    Answer: a. Network Contributor.

    Explanation: The example scenario says the engineer was preassigned as eligible for the Network Contributor role in Azure.

48. In the PIM example scenario, how long does the engineer request activation for?

    a. Four hours
    b. Four days
    c. Thirty minutes
    d. One week

    Answer: a. Four hours.

    Explanation: the engineer requests activation for a duration of four hours.

49. Which steps are explicitly part of the PIM example scenario? **(Select all that apply)**

    a. Role eligibility
    b. Role activation
    c. Approval workflow
    d. Access window
    e. Auditing and review

    Answer: a, b, c, d, e.

    Explanation: These five steps are explicitly labeled in the example scenario.

50. Which statement best summarizes the result of implementing PIM in the example scenario?

    a. The engineer completed the migration without being granted standing privileges, while the organization maintained tight control and auditability
    b. The engineer became a permanent Global Administrator after the migration
    c. The organization disabled all approval workflows to speed up access
    d. PIM replaced Conditional Access and Secure Score entirely

    Answer: a. The engineer completed the migration without being granted standing privileges, while the organization maintained tight control and auditability.

    Explanation: concludes the scenario by emphasizing temporary access, tight control over production environments, and auditable logs supporting compliance.

1.7

Troubleshoot and Monitor Identity Security

Abbreviation	Full Form
MFA	Multifactor authentication
TOTP	Time-Based One-Time Password
IP	Internet Protocol
PIM	Privileged Identity Management
POP3	Post Office Protocol version 3
IMAP	Internet Message Access Protocol
SMTP	Simple Mail Transfer Protocol
OAuth 2.0	Open Authorization 2.0
SIEM	Security Information and Event Management
API	Application Programming Interface
HR	Human Resources

1. Why is identity described as the cornerstone of security in Microsoft 365?

   a. Because identity failures or misconfigurations can lead to compromised accounts, unauthorized access, or service outages

   b. Because identity only affects email signatures

   c. Because identity replaces all audit logging

   d. Because identity matters only for administrators

   Answer: a. Because identity failures or misconfigurations can lead to compromised accounts, unauthorized access, or service outages.

   Explanation: explicitly links identity failures and misconfigurations to compromised accounts, unauthorized access, and service outages.

2. Effective troubleshooting requires which abilities? **(Select all that apply)**

   a. Technical knowledge

   b. Investigative skills

   c. Comfort navigating Microsoft Entra, Intune, Defender for Endpoint, and audit logs

   d. Only knowledge of SharePoint page design

   Answer: a, b, c.

   Explanation: effective troubleshooting requires both technical knowledge and investigative skills, plus comfort with multiple security and identity tools.

3. Proactive monitoring through audit logs helps organizations do what? **(Select all that apply)**

   a. Ensure visibility into user and admin activities

   b. Detect suspicious behavior

   c. Meet compliance requirements

   d. Eliminate the need for access controls

   Answer: a, b, c.

   Explanation: These are the exact benefits assigned to proactive monitoring in the introduction.

4. Properly managing app registrations and enterprise applications helps secure integration of custom and non-Microsoft solutions without exposing vulnerabilities. **(True/False)**

   Answer: True.

   Explanation: correct management of app registrations and enterprise applications is essential for secure integration.

5. Sign-in issues are among the most frequent challenges faced by administrators managing Microsoft 365 environments. **(True/False)**

   Answer: True.

   Explanation: The Troubleshooting common sign-in issues section begins with this point.

6. Which causes of sign-in issues are explicitly mentioned? **(Select all that apply)**

   a. Misconfigured MFA
   b. Conditional Access policies that inadvertently block legitimate users
   c. Suspicious sign-in activity detected by Microsoft's risk analysis systems
   d. Missing SharePoint themes

   Answer: a, b, c.

   Explanation: These are the exact causes listed in the documentation.

7. Which tools are specifically mentioned for troubleshooting sign-in problems? **(Select all that apply)**

   a. Sign-in logs
   b. What If simulator
   c. Microsoft Intune
   d. Defender for Endpoint

   Answer: a, b, c, d.

   Explanation: sign-in logs and What If directly, and also says admins integrate Intune and Defender for Endpoint into their workflow.

8. What is the Microsoft Entra admin center described as?

   a. The main hub for managing and troubleshooting identity and access in Microsoft 365
   b. A mail flow routing interface only
   c. A reporting tool for Teams meetings only
   d. A device imaging console only

   Answer: a. The main hub for managing and troubleshooting identity and access in Microsoft 365.

   Explanation: This is the exact description used in the documentation.

9. Which sign-in details are shown in Microsoft Entra sign-in logs? **(Select all that apply)**

   a. When and where the sign-in happened
   b. What device and app were used
   c. Whether MFA was completed
   d. Whether access was allowed or blocked

   Answer: a, b, c, d.

   Explanation: All four details are explicitly listed in the Microsoft Entra admin center description.

10. Microsoft Entra sign-in logs record every time a user—or even an automated service—tries to sign in to Microsoft 365 or connected applications. **(True/False)**

    Answer: True.

    Explanation: the logs capture every sign-in attempt by users and automated services.

11. Which common failure reasons are explicitly shown in sign-in logs? **(Select all that apply)**

    a. Incorrect password
    b. MFA required
    c. Sign-in blocked by policy
    d. Calendar sync disabled

    Answer: a, b, c.

    Explanation: These are the exact common failure reasons listed in the documentation.

12. The What If tool lets admins test Conditional Access policies without needing to perform a real sign-in.
    (True/False)

    Answer: True.

    Explanation: the What If tool exactly this way.

13. What does the What If tool show after the admin selects a specific user, device, and app?

    a. Which policies would apply and whether access would be granted or denied
    b. Only whether the password is correct
    c. Only the user's group memberships
    d. Whether PowerShell is enabled on the device

    Answer: a. Which policies would apply and whether access would be granted or denied.

    Explanation: This is the exact output described for the What If tool.

14. Scenario: A user is unexpectedly blocked from an app despite meeting all known requirements. Which tool is specifically recommended to troubleshoot this?

    a. What If tool
    b. Threat Analytics
    c. Secure Score dashboard
    d. Microsoft Graph Explorer only

    Answer: a. What If tool.

    Explanation: the What If tool is especially helpful in troubleshooting unexpected sign-in failures.

15. When users are blocked by MFA or phishing-resistant policies, which steps can help resolve the issue? **(Select all that apply)**

    a. Check the sign-in logs to confirm the failed attempts and the policy triggering the block
    b. Determine if the user's registered MFA methods match the policy requirements
    c. Reset MFA registration and re-enroll the user if necessary
    d. Ignore device clock settings for TOTP authentication

    Answer: a, b, c.

    Explanation: These are the resolution steps listed in the MFA troubleshooting scenario, while clock synchronization is also important rather than something to ignore.

16. Why is clock synchronization important for TOTP-based authentication?

    a. Because the authenticator app and Microsoft Entra ID both rely on internal clocks staying in sync
    b. Because it changes the user's group memberships
    c. Because it disables Conditional Access
    d. Because it automatically resets passwords

Answer: a. Because the authenticator app and Microsoft Entra ID both rely on internal clocks staying in sync.

Explanation: that if the device time is off, the system can think the TOTP code is invalid.

17. Which investigative steps are recommended for Conditional Access denials? **(Select all that apply)**

    a. Use the What If tool to simulate the user's sign-in scenario
    b. Verify device compliance status in Microsoft Intune
    c. Check Microsoft Defender for Endpoint for security alerts or threats on the device
    d. Remove all Conditional Access policies immediately

    Answer: a, b, c.

    Explanation: These are the investigative steps explicitly listed under Conditional Access denials.

18. Scenario: A policy requires a compliant device, but Intune reports the device as noncompliant due to missing security patches. What should admins do?

    a. Instruct the user to update or remediate the device before access is granted
    b. Grant permanent bypass access
    c. Disable Intune compliance checks for all users
    d. Convert the device into a guest account

    Answer: a. Instruct the user to update or remediate the device before access is granted.

    Explanation: this exact example and resolution path.

19. Microsoft Entra Identity Protection flags suspicious sign-ins such as impossible travel, unfamiliar locations or IP addresses, and leaked credentials. **(True/False)**

    Answer: True.

    Explanation: These are the specific examples listed in the Risky sign-ins and Identity Protection section.

20. Which response actions might admins take when a risky sign-in is confirmed? **(Select all that apply)**

    a. Require users to reset passwords
    b. Enforce MFA challenges
    c. Temporarily block access
    d. Delete the entire tenant

    Answer: a, b, c.

    Explanation: These are the explicit response actions listed in the documentation.

21. Organizations can block sign-ins from specific geographic locations or unfamiliar IP ranges as a security measure. **(True/False)**

    Answer: True.

    Explanation: organizations often configure Conditional Access policies this way.

22. Which investigative steps are recommended for sign-in issues caused by user location or IP restrictions? **(Select all that apply)**

    a. Filter sign-in logs by the affected user and examine Location and IP address fields
    b. Review the Conditional Access policy that triggered the block
    c. Verify travel itinerary or remote IP address if the user is traveling
    d. Consider a policy exception or temporary access if appropriate

    Answer: a, b, c, d.

    Explanation: All four steps are listed in the location/IP troubleshooting scenario.

23. Scenario: A sales executive attending a conference in South America is blocked because the region is outside the organization's trusted locations. Which action is specifically suggested in the documentation? **(Select all that apply)**

    a. Temporarily adjust the policy
    b. Use Just-In-Time access through PIM
    c. Enter specific IP addresses in an allow list if they're deemed safe
    d. Disable all trusted location policies permanently

    Answer: a, b, c.

    Explanation: These are the exact response options listed in the documentation.

24. Authentication failures can occur with legacy protocols or unsupported client apps because Microsoft is retiring legacy authentication in favor of modern authentication. **(True/False)**

    Answer: True.

    Explanation: that basic authentication is easy for password spray and brute-force attacks to target, so Microsoft requires modern authentication for most services.

25. Which legacy protocols are explicitly mentioned? **(Select all that apply)**

    a. POP
    b. IMAP
    c. SMTP AUTH
    d. OAuth 2.0

    Answer: a, b, c.

    Explanation: POP, IMAP, and SMTP AUTH as legacy methods, while OAuth 2.0 is the modern alternative.

26. Which investigative steps are recommended for legacy authentication failures? **(Select all that apply)**

    a. Use sign-in logs to identify client app and authentication protocol details under the Client App field
    b. Confirm if the attempted protocol is a legacy one
    c. Review conditional access policies to determine if legacy authentication is blocked
    d. Replace the user's SharePoint role with Visitor automatically

    Answer: a, b, c.

    Explanation: These are the exact investigative steps listed in the documentation.

27. Scenario: A user is trying to configure their mailbox on an older version of Outlook (pre-2013). What is the likely issue?

    a. The client doesn't support modern authentication
    b. The device is missing a Teams license
    c. The user's mailbox is archived
    d. Microsoft Entra ID is unavailable globally

    Answer: a. The client doesn't support modern authentication.

    Explanation: this exact example for unsupported client app authentication failure.

28. Audit logs are indispensable for which purposes? **(Select all that apply)**

    a. Forensic investigation of security incidents
    b. Compliance reporting
    c. Proactive monitoring of administrative actions
    d. Replacing all Conditional Access policies

Answer: a, b, c.

Explanation: These are the purposes explicitly listed in the audit logging section.

29. Audit logging captures granular data such as which activities? **(Select all that apply)**

    a. File accesses
    b. Policy changes
    c. Sign-in attempts
    d. Mailbox activities
    e. Role assignments

    Answer: a, b, c, d, e.

    Explanation: All five examples are listed in the audit logging overview.

30. Where are audit logs accessible from according to the documentation? **(Select all that apply)**

    a. Microsoft Purview portal
    b. PowerShell
    c. Only the Microsoft 365 admin center
    d. Only SharePoint admin center

    Answer: a, b.

    Explanation: audit logs are accessible through the Microsoft Purview portal and PowerShell.

31. Which roles are required to view audit logs?

    a. Audit Logs role or View-Only Audit Logs role
    b. Global Reader only
    c. Teams Communications Support role only
    d. Billing Administrator only

    Answer: a. Audit Logs role or View-Only Audit Logs role.

    Explanation: explicitly names these required roles.

32. Extending audit log insights beyond the portal can involve exporting data to which tools? **(Select all that apply)**

    a. Excel
    b. Power BI
    c. Microsoft Sentinel
    d. Splunk

    Answer: a, b, c, d.

    Explanation: These are all explicitly named as tools for advanced analysis and dashboards.

33. What benefits are listed for exporting audit data beyond the portal? **(Select all that apply)**

    a. Historical trend analysis
    b. Correlating activity across systems
    c. Building custom dashboards for reporting
    d. Eliminating the need for audit roles

    Answer: a, b, c.

    Explanation: these advanced scenarios for exported audit data.

34. Scenario: An admin wants to detect who accessed or downloaded sensitive documents in SharePoint. Which audit activities should they filter for? **(Select all that apply)**

    a. FileDownloaded
    b. FileAccessed
    c. MailboxLogin
    d. UserLoggedOut

    Answer: a, b.

    Explanation: to filter for FileDownloaded or FileAccessed when tracking unauthorized file access in SharePoint.

35. Monitoring admin role assignments can help detect what kind of risk?

    a. Unauthorized users gaining elevated privileges
    b. Too many Outlook categories
    c. Unused Teams emojis
    d. Slow OneDrive sync speeds

    Answer: a. Unauthorized users gaining elevated privileges.

    Explanation: changes to admin roles create security risks if unauthorized users gain elevated privileges.

36. Which PowerShell cmdlet is specifically named for querying role assignment changes?

    a. Search-UnifiedAuditLog
    b. Get-ADUser
    c. Set-Mailbox
    d. New-TransportRule

    Answer: a. Search-UnifiedAuditLog.

    Explanation: This cmdlet is explicitly named in the Monitoring admin role assignments example.

37. Tracking policy changes in Teams or mailbox settings helps identify what? **(Select all that apply)**

    a. Misconfigurations
    b. Unauthorized policy changes
    c. Data exposure risks
    d. Service disruption risks

    Answer: a, b, c, d.

    Explanation: this auditing helps identify misconfigurations or unauthorized policy changes that might expose data or disrupt services.

38. Advanced audit techniques include which activities? **(Select all that apply)**

    a. Automating audit log queries and exports with PowerShell
    b. Integrating audit data into SIEM platforms
    c. Customizing queries based on audit log schema and events
    d. Replacing audit logs with manual screenshots

    Answer: a, b, c.

    Explanation: These three advanced techniques are explicitly listed in the documentation.

39. Applications introduce identity and security challenges if not properly managed. **(True/False)**

    Answer: True.

    Explanation: applications are critical to workflows, but also introduce identity and security challenges if mismanaged.

40. Microsoft Entra separates which two concepts to manage app identities securely?

    a. App registrations and enterprise applications
    b. Mailboxes and archives
    c. Devices and tokens
    d. Users and printers

    Answer: a. App registrations and enterprise applications.

    Explanation: explicitly states that Microsoft Entra separates app registrations and enterprise applications.

41. What do app registrations represent?

    a. The identity and configuration metadata required to integrate an app with Microsoft identity platform
    b. A list of all users assigned to SharePoint
    c. The physical device inventory for an application
    d. A Teams policy template

    Answer: a. The identity and configuration metadata required to integrate an app with Microsoft identity platform.

    Explanation: This is the exact definition provided in the documentation.

42. What do enterprise applications represent?

    a. The actual service principals instantiated in a tenant
    b. Only documentation for app permissions
    c. The audit log history for apps
    d. A backup copy of app registrations

    Answer: a. The actual service principals instantiated in a tenant.

    Explanation: enterprise applications are the service principals users and admins interact with.

43. Proper management of app registrations and enterprise applications ensures which outcomes? **(Select all that apply)**

    a. Applications request the minimum necessary permissions
    b. Applications use secure authentication methods
    c. Applications comply with organizational security policies such as Conditional Access and MFA enforcement
    d. Applications automatically receive Global Administrator privileges

    Answer: a, b, c.

    Explanation: These are the exact secure-management outcomes listed in the documentation.

44. App registrations are the foundation for enabling applications to securely authenticate and integrate with Microsoft 365 and Microsoft Entra ID. **(True/False)**

    Answer: True.

    Explanation: explicitly describes app registrations this way.

45. When an app is registered, administrators specify which things? **(Select all that apply)**

    a. What kind of users it can work with
    b. What information or tools it needs access to
    c. Which accounts it can interact with
    d. The wallpaper theme of every user device

    Answer: a, b, c.

    Explanation: These are the exact registration details listed in the documentation.

46. How can admins or developers create app registrations? **(Select all that apply)**

    a. Manually through the Microsoft Entra admin center
    b. Programmatically through PowerShell
    c. Programmatically through the Microsoft Graph API
    d. Only through Microsoft Excel

    Answer: a, b, c.

    Explanation: app registrations can be created manually or programmatically using these methods.

47. When an app is registered, it proves its identity using what? **(Select all that apply)**

    a. A client secret
    b. A certificate
    c. A transport rule
    d. A Planner board

    Answer: a, b.

    Explanation: apps use a client secret or a certificate to prove identity.

48. Scenario: A developer builds a custom app that needs to read users' calendars. What does the admin do according to the documentation? **(Select all that apply)**

    a. Reviews the requested permissions
    b. Makes sure the app is safe and only getting the access it really needs
    c. Creates a special security key for the app
    d. Automatically grants unlimited tenant access

    Answer: a, b, c.

    Explanation: These are the exact responsibilities described in the app access security section and custom app example.

49. Which practical use case is given for a non-Microsoft app?

    a. An HR management system that lets employees sign in using their Microsoft 365 accounts
    b. A SharePoint theme designer that replaces Entra ID
    c. A printer fleet manager that disables SSO
    d. A mailbox archive tool that bypasses MFA

    Answer: a. An HR management system that lets employees sign in using their Microsoft 365 accounts.

    Explanation: an HR management system as the non-Microsoft app example.

50. Managing user consent is important because it helps prevent apps from getting too much access. **(True/False)**

    Answer: True.

    Explanation: admins should review permission requests carefully and limit which apps users are allowed to approve.

51. Which statement best summarizes the principle behind app permissions in Microsoft Entra?

    a. Give apps only the access necessary to do their job
    b. Grant every trusted app full tenant-wide access
    c. Let end users approve any permissions without review
    d. Avoid using certificates or client secrets

    Answer: a. Give apps only the access necessary to do their job.

    Explanation: least privilege and says regular permission reviews reduce security risks.

2

Introduction to Microsoft 365 Core Services and Admin Controls

2.1

Explore the Microsoft 365 Ecosystem and Core Service Components

Abbreviation	Full Form
DLP	Data Loss Prevention
MFA	Multifactor Authentication
API	Application Programming Interface
AI	Artificial Intelligence
DNS	Domain Name System
KFM	Known Folder Move
TB	Terabyte
REST	Representational State Transfer
ID	Identity

1. Microsoft 365 is more than just a suite of productivity tools. It's described as what?

   a. A standalone email platform only

   b. A comprehensive, cloud-connected ecosystem designed to support modern collaboration, communication, and content management

   c. A desktop-only productivity package

   d. A device management tool only

   Answer: b. A comprehensive, cloud-connected ecosystem designed to support modern collaboration, communication, and content management.

   Explanation: Microsoft 365 connects productivity, communication, collaboration, and content services into one unified cloud platform.

2. Why is it essential for IT professionals and administrators to understand how Microsoft 365 core services interconnect?

   a. It supports effective deployment, governance, and support.

   b. It removes the need for security policies.

   c. It prevents the use of PowerShell.

   d. It limits access to only one service.

   Answer: a. It supports effective deployment, governance, and support.

   Explanation: Service interconnection affects how administrators deploy, secure, govern, and troubleshoot the environment.

3. Which foundational Microsoft 365 components are explicitly highlighted in this training? **(Select all that apply)**

   a. Exchange Online

   b. Microsoft Teams

   c. SharePoint Online

   d. OneDrive

   e. Microsoft Copilot

Answer: a, b, c, d, e.

Explanation: These services are identified as the core components examined in this subsection.

4. Microsoft 365 is built on a layered architecture that integrates identity, services, data, intelligence, and security/compliance into a unified cloud platform. **(True/False)**

   Answer: True.

   Explanation: The architecture overview presents Microsoft 365 as a layered, unified cloud platform spanning these functions.

5. Match each Microsoft 365 architecture layer to its primary purpose.

Column A	Column B
1. Identity layer	a. Connects data across services and powers contextual intelligence
2. Service layer	b. Provides authentication, conditional access, and identity protection
3. Data layer	c. Hosts core services like Exchange, Teams, SharePoint, OneDrive, and Copilot
4. Intelligence layer	d. Delivers personalized assistance, recommendations, and automation
5. Security and compliance layer	e. Provides DLP, eDiscovery, retention, and auditing

   Answer: 1-b, 2-c, 3-a, 4-d, 5-e.

   Explanation: Each layer has a distinct responsibility, from identity validation to AI intelligence and compliance enforcement.

6. Which identity platform provides authentication, conditional access, and identity protection in the identity layer?

   a. Microsoft Purview
   b. Microsoft Entra ID
   c. Microsoft Defender for Office 365
   d. Power Automate

   Answer: b. Microsoft Entra ID.

   Explanation: The identity layer depends on Microsoft Entra ID for authentication and access security controls.

7. Which layer includes Exchange, Teams, SharePoint, OneDrive, and Copilot?

   a. Data layer
   b. Security and compliance layer
   c. Service layer
   d. Intelligence layer

   Answer: c. Service layer.

   Explanation: These are the core services running in the service layer.

8. Microsoft Graph is part of which layer in the Microsoft 365 architecture?

   a. Identity layer
   b. Data layer
   c. Security layer
   d. Device layer

   Answer: b. Data layer.

   Explanation: Microsoft Graph connects data across services, enabling insights, automation, and contextual intelligence.

9. At the heart of the architecture, Copilot acts as what?

   a. A basic mailbox processor
   b. An intelligent orchestrator
   c. A DNS management tool
   d. A static reporting dashboard

   Answer: b. An intelligent orchestrator.

   Explanation: Copilot surfaces relevant information, automates tasks, and enhances productivity across the suite.

10. Which capabilities are managed through Microsoft Entra ID across Microsoft 365 services? **(Select all that apply)**

    a. Conditional Access policies
    b. Multifactor authentication
    c. Identity protection features
    d. Mail flow transport rules

    Answer: a, b, c.

    Explanation: These identity and access controls are part of the Microsoft Entra ID foundation for Microsoft 365.

11. Microsoft Entra is the broader identity and access management platform that includes which components? **(Select all that apply)**

    a. Microsoft Entra ID
    b. Microsoft Entra Permissions Management
    c. Microsoft Entra Verified ID
    d. Microsoft Purview eDiscovery

    Answer: a, b, c.

    Explanation: Microsoft Entra extends beyond Entra ID to include permissions management and credential verification capabilities.

12. Which statement best describes Microsoft Graph?

    a. A RESTful API that provides a unified programmability model to access data across Microsoft 365
    b. A replacement for all Microsoft 365 admin centers
    c. A desktop backup utility
    d. A Teams-only chat protocol

    Answer: a. A RESTful API that provides a unified programmability model to access data across Microsoft 365.

    Explanation: Microsoft Graph connects services and data, enabling programmable access, insights, and automation.

13. Understanding the architecture is essential because a change in Conditional Access in Microsoft Entra ID can affect access to which services simultaneously? **(Select all that apply)**

    a. Teams
    b. SharePoint
    c. Exchange
    d. Planner desktop only

    Answer: a, b, c.

    Explanation: Identity-layer policy changes ripple across core Microsoft 365 services that rely on centralized access control.

14. DLP policies configured in Microsoft Purview can apply across email, chat, and file storage. **(True/False)**

    Answer: True.

    Explanation: Compliance controls span multiple workloads to enforce consistent protection and governance.

15. In Microsoft 365, domain names play a central role in establishing what? **(Select all that apply)**

    a. Organizational identity across email
    b. Collaboration identity across cloud services
    c. Branded communications
    d. Tenant-wide device encryption status

    Answer: a, b, c.

    Explanation: Domain names define branded identity across email, collaboration, and public-facing service experiences.

16. Which example is given for a custom organizational domain?

    a. contoso.com
    b. tenant-default.local
    c. microsoft.internal
    d. teams-only.net

    Answer: a. contoso.com.

    Explanation: Custom domains such as contoso.com align Microsoft 365 with an organization's public identity.

17. Which default domains are explicitly mentioned as examples provided by Microsoft? **(Select all that apply)**

    a. contoso.onmicrosoft.com
    b. fabrikam.onmicrosoft.com
    c. contoso.sharepoint.local
    d. fabrikam.exchange.private

    Answer: a, b.

    Explanation: These examples show Microsoft-provided default tenant domains before a custom domain is added.

18. Adding a custom domain to Microsoft 365 involves which steps or outcomes? **(Select all that apply)**

    a. Verifying ownership through DNS records
    b. Configuring services like Exchange Online, SharePoint Online, and Teams to use that domain
    c. Assigning user accounts, distribution lists, and shared mailboxes to use the custom domain
    d. Removing Microsoft Entra ID from the tenant

    Answer: a, b, c.

    Explanation: Custom domain onboarding requires verification, service configuration, and assignment to identities and shared resources.

19. Microsoft 365 supports multiple domains within a single tenant, which is useful for organizations with multiple brands, subsidiaries, or geographic regions. **(True/False)**

    Answer: True.

    Explanation: Multiple domains help organizations manage identity and communications across brands, business units, and regions.

20. Which service is described as Microsoft's cloud-based email and calendaring service?

    a. SharePoint Online
    b. OneDrive

c. Exchange Online
d. Microsoft Teams

Answer: c. Exchange Online.

Explanation: Exchange Online is positioned as the communication backbone for email and calendaring.

21. Which built-in security capabilities are specifically listed for Exchange Online? **(Select all that apply)**

    a. Anti-malware
    b. Anti-spam
    c. Data loss prevention
    d. Endpoint analytics

    Answer: a, b, c.

    Explanation: Exchange Online includes built-in protections for malware, spam, and sensitive data handling.

22. In Exchange Online, which three primary object types are created to support organizational communication?

    Answer: User mailboxes, shared mailboxes, and distribution lists.

    Explanation: These three object types support individual mail use, team mail access, and group communication.

23. Which statement best describes shared mailboxes?

    a. They allow multiple users to access and manage email from a common mailbox.
    b. They are only for sending anonymous mail externally.
    c. They replace user mailboxes entirely.
    d. They can't be used by teams or departments.

    Answer: a. They allow multiple users to access and manage email from a common mailbox.

    Explanation: Shared mailboxes support shared ownership and coordinated communication for teams or departments.

24. Transport rules are also known as what?

    a. Mail flow rules
    b. Access packages
    c. Compliance labels
    d. Routing channels

    Answer: a. Mail flow rules.

    Explanation: Transport rules inspect email content and headers so administrators can enforce messaging policies.

25. Which actions are explicitly described as examples of Exchange Online mail flow controls? **(Select all that apply)**

    a. Encrypting messages containing sensitive data
    b. Blocking messages with specific attachments
    c. Disabling OneDrive sync
    d. Inspecting email content and headers

    Answer: a, b, d.

    Explanation: Mail flow rules examine message content and headers to enforce security and compliance actions.

26. Exchange Online supports hybrid configurations where some mailboxes remain on-premises while others move to the cloud. **(True/False)**

    Answer: True.

    Explanation: Hybrid Exchange supports staged or mixed mailbox placement during migration and long-term coexistence.

27. Microsoft Teams is described as what within Microsoft 365?

    a. The collaboration hub of Microsoft 365
    b. The device enrollment portal
    c. The backup and restore service
    d. The core email server

    Answer: a. The collaboration hub of Microsoft 365.

    Explanation: Teams combines chat, meetings, calling, and app integration in a single collaboration interface.

28. Teams is built on top of which Microsoft 365 services? **(Select all that apply)**

    a. Microsoft 365 Groups
    b. SharePoint
    c. Exchange group mailbox
    d. Azure Firewall

    Answer: a, b, c.

    Explanation: Team creation provisions group-connected resources across SharePoint and Exchange through Microsoft 365 Groups.

29. Persistent chat in Teams is organized through what?

    a. Channels
    b. Mail flow rules
    c. DNS zones
    d. Retention labels

    Answer: a. Channels.

    Explanation: Channels organize conversations, files, and app tabs by topic or project.

30. Which Teams meeting features are specifically listed? **(Select all that apply)**

    a. Screen sharing
    b. Recording
    c. Transcription
    d. Breakout rooms

    Answer: a, b, c, d.

    Explanation: Teams meetings integrate with Outlook and include these collaboration and meeting-management capabilities.

31. Which management controls can admins configure for Microsoft Teams? **(Select all that apply)**

    a. Meeting policies
    b. Messaging restrictions
    c. App permissions
    d. SharePoint version history settings

    Answer: a, b, c.

    Explanation: Teams administration includes policy control over meetings, messaging, and app usage.

32. Policies in Teams can be assigned to users how? **(Select all that apply)**

    a. Individually
    b. In bulk using policy packages

c. Through group-based assignment
d. Only through Outlook categories

Answer: a, b, c.

Explanation: Teams policy assignment can be targeted per user or scaled using policy packages and groups.

33. SharePoint Online is the content management and intranet platform within Microsoft 365. **(True/False)**

Answer: True.

Explanation: SharePoint Online supports intranet publishing, document management, and process automation.

34. Which two main types of SharePoint sites are listed?

Answer: Communication sites and team sites.

Explanation: Communication sites are used for broad information sharing, while team sites support collaborative work tied to Microsoft 365 Groups.

35. Document libraries in SharePoint support which capabilities? **(Select all that apply)**

a. Versioning
b. Metadata tagging
c. Real-time co-authoring with Office apps
d. Hardware token registration

Answer: a, b, c.

Explanation: These capabilities make SharePoint document libraries effective for structured, collaborative content management.

36. Which tools can enhance SharePoint lists? **(Select all that apply)**

a. Power Automate workflows
b. Power Apps forms
c. Exchange transport rules
d. Defender for Endpoint alerts

Answer: a, b.

Explanation: Lists can be extended with workflow automation and custom form experiences.

37. Folders in SharePoint document libraries can do which of the following? **(Select all that apply)**

a. Organize content hierarchically
b. Be created manually
c. Be created automatically using Power Automate
d. Inherit metadata from the library

Answer: a, b, c, d.

Explanation: Folders help structure content and can participate in metadata and automation workflows.

38. OneDrive is designed for what primary purpose?

a. Individual file storage and sharing
b. Organization-wide mail flow routing
c. Network firewall configuration
d. Tenant-wide meeting transcription

Answer: a. Individual file storage and sharing.

Explanation: OneDrive is the personal cloud storage service for Microsoft 365 users.

39. Each user typically receives how much OneDrive storage?

    a. 100 GB
    b. 500 GB
    c. 1 TB
    d. 5 TB by default for every license

    Answer: c. 1 TB.

    Explanation: OneDrive commonly provides 1 TB per user, with expansion options based on licensing and usage.

40. What does Known Folder Move (KFM) do in OneDrive? **(Select all that apply)**

    a. Redirects Desktop to OneDrive
    b. Redirects Documents to OneDrive
    c. Redirects Pictures to OneDrive
    d. Backs up these folders to the cloud

    Answer: a, b, c, d.

    Explanation: KFM redirects key Windows folders into OneDrive so they are synchronized, backed up, and protected.

41. Which sharing controls are specifically listed for OneDrive? **(Select all that apply)**

    a. View or edit permissions
    b. Expiration dates
    c. Password requirements
    d. Hardware token pairing

    Answer: a, b, c.

    Explanation: OneDrive sharing can be constrained using permission levels, expirations, and password-protected links.

42. Scenario: A user working on a quarterly report saves the file to OneDrive and shares it with their manager using a secure link. If the file is accidentally deleted or overwritten, which capability helps recover it?

    a. Version history
    b. Teams policy packages
    c. Exchange journaling
    d. Conditional Access simulation

    Answer: a. Version history.

    Explanation: Version history allows the user to restore a previous version of the file after deletion or overwrite.

43. Copilot is described as Microsoft 365's built-in AI assistant. **(True/False)**

    Answer: True.

    Explanation: Copilot is positioned as an AI assistant embedded across Microsoft 365 apps and services.

44. Which core service component features are specifically listed for Copilot? **(Select all that apply)**

    a. Contextual assistance
    b. Content generation
    c. Workflow automation
    d. Personalized insights

    Answer: a, b, c, d.

    Explanation: These are the four primary feature areas listed for Copilot as a core service component.

45. In which apps is Copilot explicitly said to help with drafting or creating content? **(Select all that apply)**

    a. Word
    b. PowerPoint
    c. Outlook
    d. Defender portal

    Answer: a, b, c.

    Explanation: Content generation examples are given for Word, PowerPoint, and Outlook.

46. Which examples of Copilot workflow automation are explicitly mentioned? **(Select all that apply)**

    a. Summarizing meeting transcripts
    b. Generating action items
    c. Creating reports from data in Excel or SharePoint
    d. Resetting Microsoft Entra passwords automatically for all users

    Answer: a, b, c.

    Explanation: Copilot automates repetitive information work, including summarization, action tracking, and report generation.

47. Agents in Microsoft 365 are intelligent, task-oriented digital helpers that can perform actions, answer questions, and automate workflows based on user intent. **(True/False)**

    Answer: True.

    Explanation: Agents act as purpose-driven assistants that use context and intent to support users across Microsoft 365.

48. Which agent capabilities are specifically listed? **(Select all that apply)**

    a. Task automation
    b. Personalized assistance
    c. Conversational interaction
    d. Extensibility

    Answer: a, b, c, d.

    Explanation: These are the key ways agents help users work more efficiently.

49. Scenario: An agent monitors a SharePoint library and notifies a team when a new document is uploaded, or starts an approval workflow in Teams. Which agent capability does this illustrate?

    a. Task automation
    b. Static storage
    c. Password rotation
    d. DNS verification

    Answer: a. Task automation.

    Explanation: The example shows an agent automating a workflow trigger and response across services.

50. Which platform is specifically named for building custom agents?

    a. Microsoft Copilot Studio
    b. Microsoft Sentinel
    c. Microsoft Purview
    d. Microsoft Intune

Answer: a. Microsoft Copilot Studio.

Explanation: Custom agents can be built with Microsoft Copilot Studio to support specialized business scenarios.

51. As the Intelligence Layer engine, Copilot connects signals from across Microsoft 365 through what?

    a. Microsoft Graph data layer
    b. Exchange transport rules
    c. Windows registry sync
    d. DNS forwarding

    Answer: a. Microsoft Graph data layer.

    Explanation: Microsoft Graph provides the signals, relationships, and workflow context that power the Intelligence Layer.

52. Microsoft Graph respects which built-in Microsoft 365 security and compliance controls? **(Select all that apply)**

    a. Role-based access
    b. Sensitivity labels
    c. Conditional Access policies
    d. Unrestricted anonymous access

    Answer: a, b, c.

    Explanation: Graph only returns data the user is authorized to view, honoring authorization and governance controls.

53. Which key functions of Copilot in the Intelligence Layer are explicitly listed? **(Select all that apply)**

    a. Contextual intelligence
    b. Cross-service automation
    c. Personalized recommendations
    d. Conversational interaction
    e. Extensibility with Copilot Studio
    f. Governance and control

    Answer: a, b, c, d, e, f.

    Explanation: These six functions define how Copilot and agents operate within the Intelligence Layer.

54. Which statement best describes Microsoft Purview in this architecture?

    a. A centralized console for data governance, compliance management, and risk mitigation
    b. A replacement for Microsoft Entra ID
    c. A Teams-only meeting service
    d. A OneDrive sync engine

    Answer: a. A centralized console for data governance, compliance management, and risk mitigation.

    Explanation: Microsoft Purview unifies security, compliance, governance, and data protection capabilities.

55. Which security and compliance capabilities are explicitly listed under Microsoft 365? **(Select all that apply)**

    a. Sensitivity labels
    b. DLP policies
    c. eDiscovery
    d. Audit logs
    e. Retention policies

Answer: a, b, c, d, e.

Explanation: These capabilities support classification, protection, legal response, monitoring, and retention.

56. Copilot respects data access permissions, applies DLP and sensitivity labels, and logs interactions for auditing. **(True/False)**

    Answer: True.

    Explanation: Copilot operates within Microsoft 365's security and compliance boundaries rather than bypassing them.

57. Which statement best summarizes the role of Copilot within Microsoft 365's security and compliance framework?

    a. AI-powered assistance is delivered while data access, compliance, and privacy controls remain enforced
    b. Copilot ignores DLP and retention controls to increase productivity
    c. Copilot can access all tenant data regardless of permissions
    d. Copilot replaces Microsoft Purview and Microsoft Defender entirely

    Answer: a. AI-powered assistance is delivered while data access, compliance, and privacy controls remain enforced.

    Explanation: Assistance remains aligned with governance requirements because access permissions, DLP, sensitivity labels, and auditing continue to apply.

2.2

Explore the Microsoft 365 admin center and key admin tools

Abbreviation	Full Form
IT	Information Technology
E3	Enterprise 3
E5	Enterprise 5
MFA	Multifactor Authentication
EAC	Exchange admin center
DNS	Domain Name System

1. The Microsoft 365 admin center is best described as:

   a. A service-specific portal only for Exchange Online

   b. The central hub for managing users, services, configurations, and health across a Microsoft 365 environment

   c. A billing-only interface for subscription purchases

   d. A desktop application installed on admin workstations

   Answer: b. The central hub for managing users, services, configurations, and health across a Microsoft 365 environment.

   Explanation: The admin center brings together administration for identities, services, settings, and monitoring in one web-based portal.

2. The Microsoft 365 admin center is accessible at which address?

   a. admin.microsoft.com

   b. outlook.office.com

   c. teams.microsoft.com

   d. entra.microsoft.com

   Answer: a. admin.microsoft.com.

   Explanation: This is the web portal used to sign in and manage a Microsoft 365 tenant.

3. The Microsoft 365 admin center provides a unified interface for managing what?

   Answer: Your Microsoft 365 tenant.

   Explanation: Tenant-wide administration is centralized so admins can manage users, services, settings, and health from one place.

4. The features and settings visible in the admin center depend on assigned admin roles such as Global Admin, Exchange Admin, and Teams Admin. **(True/False)**

   Answer: True.

   Explanation: The interface is role-aware, so each administrator sees capabilities aligned to their responsibilities.

5. Which items are summarized on the dashboard after an admin logs in? **(Select all that apply)**

   a. User activity

   b. License usage

   c. Service health

d. Recommended actions
e. Source code repositories

Answer: a, b, c, d.

Explanation: The dashboard gives a quick operational view of adoption, licensing, service status, and next steps.

6. Which categories are specifically listed in the navigation pane? **(Select all that apply)**

   a. Users
   b. Devices
   c. Roles
   d. Billing
   e. Reports
   f. Settings

   Answer: a, b, c, d, e, f.

   Explanation: These categories organize administration into major functional areas with submenus for deeper control.

7. Under **Users**, which tasks are specifically mentioned? **(Select all that apply)**

   a. Managing active users
   b. Managing guest access
   c. Managing contact details
   d. Configuring mail flow connectors

   Answer: a, b, c.

   Explanation: The Users area focuses on user identities and related profile information, not advanced mail routing.

8. Selecting Exchange settings from the Microsoft 365 admin center redirects to which portal?

   a. Teams admin center
   b. Exchange admin center
   c. SharePoint admin center
   d. Message Center

   Answer: b. Exchange admin center.

   Explanation: Exchange administration opens the dedicated service portal for deeper email and mailbox management.

9. The modular approach of the admin center supports both high-level oversight and deep service-specific configuration. **(True/False)**

   Answer: True.

   Explanation: Central administration stays unified while specialized portals provide more granular controls for each workload.

10. In Microsoft 365, what directly determines which features and services a user or group can access?

    a. Device manufacturer
    b. License type
    c. Browser choice
    d. Help desk queue assignment

    Answer: b. License type.

    Explanation: Access to Microsoft 365 capabilities is tied to the licenses assigned to users or groups.

11. Which core productivity tools are listed for users with Microsoft 365 E3 licenses? **(Select all that apply)**

    a. Exchange Online
    b. SharePoint Online
    c. Microsoft Teams
    d. Microsoft Defender for Office 365

    Answer: a, b, c.

    Explanation: E3 includes the major productivity workloads, while some advanced security and compliance features sit in higher tiers.

12. Which advanced capabilities are listed as part of Microsoft 365 E5? **(Select all that apply)**

    a. Microsoft Defender for Office 365
    b. eDiscovery
    c. Compliance analytics
    d. Accepted domains

    Answer: a, b, c.

    Explanation: E5 extends beyond core productivity with stronger security, investigation, and compliance capabilities.

13. Organizations can assign licenses individually or use group-based licensing through the Microsoft 365 admin center. **(True/False)**

    Answer: True.

    Explanation: Both assignment methods are available, allowing admins to choose manual control or automated group-based provisioning.

14. What is a primary benefit of group-based licensing?

    Answer: It automatically provisions licenses to all members of a group.

    Explanation: Group membership becomes the driver for license assignment, which reduces repetitive manual work.

15. Which limitations of group-based licensing are specifically mentioned? **(Select all that apply)**

    a. Maximum of 20 groups per assignment
    b. No support for nested groups
    c. Maximum of 20 users per group
    d. Requires local Active Directory only

    Answer: a, b.

    Explanation: Group-based licensing simplifies administration, but assignment limits and lack of nested group support must be considered.

16. Before license enforcement works correctly, each user must have which attribute set?

    a. Department
    b. Location
    c. Job title
    d. Manager

    Answer: b. Location.

    Explanation: Licensing depends on the user location attribute, so it must be configured before assignment is enforced properly.

17. Under **Users** > **Active Users**, which common tasks can admins perform? **(Select all that apply)**

a. Create new users manually
b. Create users through bulk import
c. Assign or remove Microsoft 365 licenses
d. Reset passwords and configure MFA
e. Set location, department, and job title metadata

Answer: a, b, c, d, e.

Explanation: Active user management combines identity creation, security setup, licensing, and profile metadata updates.

18. Licenses are managed under which area of the Microsoft 365 admin center?

a. Reports > Usage
b. Billing > Licenses
c. Settings > Org Settings
d. Roles > Role assignments

Answer: b. Billing > Licenses.

Explanation: Subscription availability, assignment, and purchasing are handled from the licensing area under Billing.

19. Which group types are specifically listed for organizing users and controlling access to resources? **(Select all that apply)**

a. Microsoft 365 groups
b. Security groups
c. Distribution lists
d. Nested entitlement bundles

Answer: a, b, c.

Explanation: These group types help structure access, communication, and license or policy management across the tenant.

20. Scenario: An admin creates a new account for a remote employee, assigns a Microsoft 365 E3 license, enables MFA, and adds the user to the `Remote Workers` security group. Which services are explicitly listed as part of the resulting access? **(Select all that apply)**

a. Exchange
b. Teams
c. OneDrive
d. SharePoint
e. Power BI Premium

Answer: a, b, c, d.

Explanation: The example ties the E3 assignment and group membership to access across the core collaboration and productivity services.

21. Microsoft 365 is composed of several core services, each with its own dedicated admin center. Which services are specifically named? **(Select all that apply)**

a. Exchange Online
b. Microsoft Teams
c. SharePoint Online
d. Power Automate Desktop

Answer: a, b, c.

Explanation: These major workloads each have specialized portals for configuration, policy management, and monitoring.

22. Match each admin center to one task it is specifically associated with.

Admin center	Task
Exchange admin center	Configure mail flow rules, connectors, and accepted domains
Teams admin center	Configure meeting policies, messaging settings, and app permissions
SharePoint admin center	Manage site collections and storage quotas

Answer: Exchange admin center → mail flow rules, connectors, and accepted domains; Teams admin center → meeting policies, messaging settings, and app permissions; SharePoint admin center → site collections and storage quotas.

Explanation: Each service-specific portal is built around the operational and governance needs of its own workload.

23. Which tasks are specifically listed under the Exchange admin center (EAC)? **(Select all that apply)**

    a. Manage mailboxes, shared mailboxes, and resource mailboxes
    b. Configure mail flow rules, connectors, and accepted domains
    c. Set retention policies and litigation hold
    d. Monitor site storage quotas

Answer: a, b, c.

Explanation: Exchange administration includes mailbox management, transport configuration, and compliance-oriented mailbox controls.

24. Which tasks are specifically listed under the Teams admin center? **(Select all that apply)**

    a. Create and manage teams and channels
    b. Configure meeting policies, messaging settings, and app permissions
    c. Monitor call quality and usage analytics
    d. Configure accepted domains

Answer: a, b, c.

Explanation: Teams administration focuses on collaboration spaces, communications policies, and service performance monitoring.

25. Which tasks are specifically listed under the SharePoint admin center? **(Select all that apply)**

    a. Manage site collections and storage quotas
    b. Configure sharing policies and access controls
    c. Monitor activity and usage trends
    d. Manage mailbox litigation hold

Answer: a, b, c.

Explanation: SharePoint administration centers on content sites, storage, sharing governance, and usage visibility.

26. OneDrive settings are managed within which admin center?

    a. Exchange admin center
    b. Teams admin center

c. SharePoint admin center

d. Microsoft Entra admin center

Answer: c. SharePoint admin center.

Explanation: OneDrive administrative controls are handled as part of SharePoint service management.

27. Which OneDrive settings are specifically listed? **(Select all that apply)**

    a. Sync behavior

    b. Sharing permissions

    c. Storage limits

    d. Retention policies

    e. Device access

    Answer: a, b, c, d, e.

    Explanation: OneDrive administration includes syncing, storage, retention, sharing, and device-related access controls.

28. Scenario: Users report issues with file sharing in Teams. According to the documented example, which portals might an admin need to investigate? **(Select all that apply)**

    a. Teams admin center

    b. SharePoint admin center

    c. Exchange admin center

    d. Billing > Licenses

    Answer: a, b.

    Explanation: Teams file sharing relies on settings across both the Teams and SharePoint workloads, so both portals may be relevant.

29. Under **Org Settings**, which configurations are specifically mentioned? **(Select all that apply)**

    a. Define data residency

    b. Enable or restrict external sharing

    c. Configure collaboration boundaries across services like Teams and SharePoint

    d. Configure hardware warranty renewals

    Answer: a, b, c.

    Explanation: Org Settings shapes tenant-wide collaboration and governance behavior across key Microsoft 365 services.

30. What can multitenant organization owners manage in the admin center? **(Select all that apply)**

    a. Tenant roles

    b. Calendar sharing

    c. Collaboration settings

    d. BIOS firmware updates

    Answer: a, b, c.

    Explanation: These settings support secure and seamless cross-tenant operations in multitenant environments.

31. One of the first tasks admins often perform is customizing what?

    Answer: The organization profile.

    Explanation: Organization profile settings establish branding and contact details that appear across Microsoft 365 services.

32. Which organization profile elements are specifically listed? **(Select all that apply)**

    a. Company name
    b. Logo
    c. Contact information
    d. Transport rule priority

    Answer: a, b, c.

    Explanation: These branding elements help users recognize official portals and communications.

33. Enabling security defaults can do which of the following? **(Select all that apply)**

    a. Enforce modern authentication
    b. Require MFA for all users
    c. Block legacy authentication protocols
    d. Apply baseline security policies

    Answer: a, b, c, d.

    Explanation: Security defaults provide a baseline posture by strengthening identity protection and reducing reliance on weaker legacy methods.

34. External sharing settings are especially relevant for which services?

    a. SharePoint and OneDrive
    b. Exchange and Defender
    c. Intune and Sentinel
    d. Planner and Viva Engage

    Answer: a. SharePoint and OneDrive.

    Explanation: These services often store documents and collaboration content that may be shared with people outside the organization.

35. Which external sharing controls are specifically listed? **(Select all that apply)**

    a. Allow or restrict guest access
    b. Require authentication for shared links
    c. Set expiration dates for access
    d. Automatically grant anonymous edit access everywhere

    Answer: a, b, c.

    Explanation: These controls limit how external users access shared content and help balance collaboration with governance.

36. Scenario: An organization allows external sharing for project collaboration but restricts it for Finance and Legal departments. What goal does this support?

    Answer: Maintaining compliance.

    Explanation: Departments handling more sensitive information may need tighter sharing controls to reduce compliance and data exposure risks.

37. Email signatures and disclaimers can be configured using what in Exchange?

    a. Retention labels
    b. Transport rules
    c. Site templates
    d. Sensitivity label policies

Answer: b. Transport rules.

Explanation: Exchange transport rules can append disclaimers to outbound messages as they pass through mail flow.

38. Monitoring in the Microsoft 365 admin center helps admins do which of the following? **(Select all that apply)**

    a. Detect issues early
    b. Assess service performance
    c. Make informed decisions
    d. Maintain uptime
    e. Optimize resource usage

    Answer: a, b, c, d, e.

    Explanation: Monitoring tools combine operational awareness with usage insights so admins can respond faster and plan more effectively.

39. The Service Health Dashboard provides real-time visibility into what? **(Select all that apply)**

    a. Incidents
    b. Advisories
    c. Planned maintenance events
    d. Resolution timelines

    Answer: a, b, c, d.

    Explanation: Service health reporting covers current issues, planned changes, and the progress toward resolution.

40. Admins can subscribe to email alerts for specific services from the Service Health Dashboard. **(True/False)**

    Answer: True.

    Explanation: Service-specific alert subscriptions help admins receive timely notification when issues arise.

41. Which metrics are specifically listed in usage reports and insights? **(Select all that apply)**

    a. Active users
    b. Storage consumption
    c. Collaboration patterns
    d. BIOS version counts

    Answer: a, b, c.

    Explanation: Usage reports focus on adoption, storage, and collaboration behavior across Microsoft 365 services.

42. What complements health monitoring and usage reporting by providing updates on new features, deprecations, and configuration recommendations?

    a. Message Center
    b. Azure Monitor agent
    c. Windows Event Viewer
    d. Defender XDR queue

    Answer: a. Message Center.

    Explanation: Message Center helps admins prepare for platform changes and follow Microsoft guidance for upcoming updates.

43. If Microsoft announces a change to Teams meeting policies, where would guidance on preparation and implementation appear?

    Answer: In the Message Center.

    Explanation: Message Center posts include rollout details, impacts, and recommended admin actions for service changes.

44. While the Microsoft 365 admin center provides a graphical interface, many advanced tasks are best handled through what?

    Answer: PowerShell.

    Explanation: Scripting is better suited for bulk operations, complex queries, automation, and integration with other systems.

45. Which PowerShell tools are specifically listed? **(Select all that apply)**

    a. Exchange Online PowerShell
    b. Teams PowerShell Module
    c. SharePoint Online Management Shell
    d. Microsoft Graph PowerShell SDK

    Answer: a, b, c, d.

    Explanation: These tools provide service-specific and unified scripting options across Microsoft 365 workloads.

46. Which statement best describes the Microsoft Graph PowerShell SDK?

    a. It is used only for Teams meeting recordings
    b. It provides unified API access across services
    c. It replaces all admin centers permanently
    d. It manages on-premises Group Policy only

    Answer: b. It provides unified API access across services.

    Explanation: Microsoft Graph PowerShell connects to a broad set of Microsoft 365 services through a single API-based approach.

47. PowerShell enables which administrative advantages? **(Select all that apply)**

    a. Bulk operations
    b. Scheduled tasks
    c. Integration with other systems
    d. Automated provisioning and cleanup

    Answer: a, b, c, d.

    Explanation: Automation reduces manual effort and allows consistent execution of repeatable administrative processes.

48. Which example task is specifically mentioned for automation with PowerShell?

    a. Checking for mailboxes with no activity in the past 90 days and disabling those accounts automatically
    b. Replacing all SharePoint sites with Teams channels
    c. Installing desktop applications on unmanaged personal devices
    d. Granting Global Admin to every help desk user

    Answer: a. Checking for mailboxes with no activity in the past 90 days and disabling those accounts automatically.

    Explanation: That example shows how scripting can improve both security and license usage by identifying inactive accounts.

49. Scenario: Users report issues accessing email. What is the first Microsoft 365 admin center tool the admin checks in the documented scenario?

    a. Service Health Dashboard
    b. SharePoint admin center
    c. Billing > Licenses

d. Viva Insights dashboard

Answer: a. Service Health Dashboard.

Explanation: The outage response starts with verifying whether Microsoft is reporting a service-side issue affecting Exchange Online.

50. After finding an Exchange Online incident, what actions are specifically described next? **(Select all that apply)**

    a. Subscribe to updates

    b. Notify users through Teams

    c. Monitor the Message Center for resolution timelines

    d. Delete all inactive accounts

    Answer: a, b, c.

    Explanation: The response combines monitoring, communication, and ongoing tracking of Microsoft's remediation progress.

51. In the outage scenario, which PowerShell tool is used to verify mail flow?

    a. Teams PowerShell Module

    b. Exchange Online PowerShell

    c. SharePoint Online Management Shell

    d. Microsoft Graph PowerShell SDK only

    Answer: b. Exchange Online PowerShell.

    Explanation: Exchange Online PowerShell is used to confirm that internal mail flow settings are not the cause of the issue.

52. Once Microsoft resolves the incident, what two follow-up actions are specifically mentioned?

    Answer: Send a follow-up message to users and update internal documentation.

    Explanation: Closing the loop requires both user communication and recordkeeping for future operational reference.

53. Put these outage-response steps in the correct order: check the Service Health Dashboard, verify mail flow with Exchange Online PowerShell, notify users through Teams, update internal documentation.

    Answer: Check the Service Health Dashboard → notify users through Teams → verify mail flow with Exchange Online PowerShell → update internal documentation.

    Explanation: The sequence starts with confirming the incident, continues with communication and technical verification, and ends with documentation after resolution.

54. Knowing where to look, how to communicate, and how to act quickly is a key lesson of the service outage scenario. **(True/False)**

    Answer: True.

    Explanation: Effective Microsoft 365 administration depends on quickly combining visibility, communication, and action across the available tools.

2.3

Examine Microsoft Exchange, Teams, and SharePoint

Abbreviation	Full Form
DLP	Data Loss Prevention
EAC	Exchange admin center
RBAC	Role-Based Access Control
MFA	Multifactor Authentication

1. Microsoft 365's core collaboration services that form the backbone of modern workplace communication, collaboration, and content management are:

   a. Exchange Online, Teams, and SharePoint Online
   b. Only Exchange Online and OneDrive
   c. Only Teams and Power BI
   d. Only SharePoint Online and Yammer

   Answer: a. Exchange Online, Teams, and SharePoint Online.

   Explanation: These three services form the backbone of modern workplace communication, collaboration, and content management.

2. Configuring Microsoft 365's core collaboration services is essential for enabling which outcomes? **(Select all that apply)**

   a. Secure operations
   b. Efficient operations
   c. Seamless communication and teamwork
   d. Scalable operations

   Answer: a, b, c, d.

   Explanation: Their initial setup lays the groundwork for secure, efficient, and scalable operations while enforcing organizational policies, compliance requirements, and user experience standards.

3. Which service handles email, calendaring, and mail flow for the organization?

   a. SharePoint Online
   b. Microsoft Teams
   c. Exchange Online
   d. Microsoft Purview

   Answer: c. Exchange Online.

   Explanation: Exchange Online handles email, calendaring, and mail flow. Administrators must provision mailboxes, set up mail routing, and apply security policies.

4. Which service provides the platform for document management, team collaboration, and intranet portals?

   a. Exchange Online
   b. Microsoft Teams
   c. SharePoint Online

d. Microsoft Entra ID

Answer: c. SharePoint Online.

Explanation: SharePoint Online configuration involves site provisioning, library setup, and permission management to ensure users can access and share content securely.

5. Which service brings together chat, meetings, calls, and app integrations?

   a. Exchange Online
   b. Microsoft Teams
   c. SharePoint Online
   d. OneDrive

   Answer: b. Microsoft Teams.

   Explanation: Microsoft Teams setup requires careful planning of team structures, channel organization, and policy enforcement.

6. To update Exchange Online settings, admins must be assigned which roles? **(Select all that apply)**

   a. Global administrator
   b. Exchange administrator
   c. Organization Management role group

   Answer: a, b, c.

   Explanation: Global administrator provides full access but should be used sparingly. Exchange administrator manages mailboxes, mail flow, and anti-spam policies. Organization Management grants access to most Exchange Online features through the EAC or PowerShell.

7. Exchange Online uses RBAC roles such as Role Management and View-Only Organization Management. **(True/False)** **Answer:** True.

   Explanation: Role Management allows creation and modification of role groups. View-Only Organization Management provides helpdesk-style access.

8. End-user roles in Exchange Online are assigned through:

   a. Direct assignment to users
   b. Role assignment policies
   c. SharePoint groups only
   d. Teams policies only

   Answer: b. Role assignment policies.

   Explanation: These roles aren't assigned directly to users. Instead, they are bundled into role assignment policies managed by admins in the EAC.

9. Mailbox creation is the first and most fundamental step in configuring Exchange Online. **(True/False) Answer:** True.

   Explanation: Every user who needs email access must have a mailbox, which is automatically provisioned when a user is assigned an Exchange Online license.

10. Which mailbox type is automatically provisioned when a user is assigned an Exchange Online license in the Microsoft 365 admin center?

    a. Shared mailbox
    b. Resource mailbox
    c. User mailbox
    d. Equipment mailbox only

Answer: c. User mailbox.

Explanation: Assigning an Exchange Online license triggers automatic mailbox provisioning with a default quota such as 50 GB or 100 GB.

11. Shared mailboxes are designed for scenarios where multiple users need access to a common email address. **(True/False) Answer:** True.

    Explanation: Examples include support@contoso.com or info@contoso.com. These mailboxes don't require a separate license unless accessed with mobile devices.

12. Resource mailboxes are used to manage:

    a. Rooms and equipment
    b. Group email addresses
    c. Personal user email only
    d. Archive storage

    Answer: a. Rooms and equipment.

    Explanation: Resource mailboxes can be configured to automatically accept or decline meeting requests based on availability and enforce booking policies.

13. Transport rules are also known as:

    a. Retention policies
    b. Mail flow rules
    c. Sensitivity labels
    d. Site templates

    Answer: b. Mail flow rules.

    Explanation: Transport rules allow administrators to inspect email content, headers, and attachments to enforce organizational policies.

14. Accepted domains define:

    a. The email domains that Exchange Online can handle for an organization
    b. Only on-premises server names
    c. Teams channel types
    d. SharePoint site templates

    Answer: a. The email domains that Exchange Online can handle for an organization.

    Explanation: Administrators add domains in the EAC and verify ownership to enable mail flow.

15. Retention policies help organizations manage the lifecycle of email data by specifying:

    a. How long messages are retained before deletion
    b. Only mailbox quotas
    c. External sharing settings
    d. Team creation permissions

    Answer: a. How long messages are retained before deletion.

    Explanation: Administrators create retention tags and policies in the EAC and assign them to mailboxes.

16. Litigation hold preserves all email content in a mailbox, including deleted items and original versions, for legal discovery purposes. **(True/False) Answer:** True.

    Explanation: Administrators enable litigation hold in the EAC and specify hold duration.

17. SharePoint Online configuration involves which key activities? **(Select all that apply)**

a. Site provisioning
b. Library setup
c. Permission management

Answer: a, b, c.

Explanation: These ensure users can access and share content securely while supporting advanced features such as versioning, metadata tagging, and real-time co-authoring.

18. To configure SharePoint Online, admins must be assigned which roles? **(Select all that apply)**

a. Global administrator
b. SharePoint administrator

Answer: a, b.

Answer: Global administrator provides full access but should be used sparingly. SharePoint administrator manages site collections, permissions, and sharing policies.

19. Team sites in SharePoint are automatically linked to:

a. Microsoft 365 Groups
b. Only communication sites
c. Exchange transport rules
d. Resource mailboxes

Answer: a. Microsoft 365 Groups.

Explanation: When a team site is created, it provisions a shared document library, group mailbox, and calendar.

20. Communication sites are intended for:

a. Broadcasting information to a wide audience
b. Private team collaboration only
c. Equipment booking only
d. Personal OneDrive storage

Answer: a. Broadcasting information to a wide audience.

Explanation: These sites feature visually rich layouts for company news, policies, or training materials.

21. Document libraries in SharePoint support which features? **(Select all that apply)**

a. Versioning
b. Metadata tagging
c. Real-time co-authoring

Answer: a, b, c.

Explanation: Administrators configure libraries to enable version history, set metadata fields, and define content types.

22. Permission inheritance in SharePoint means objects inherit permissions from their parent container unless inheritance is broken. **(True/False) Answer:** True.

Explanation: Administrators can break inheritance to apply unique permissions at any level.

23. Microsoft Teams is built on Microsoft 365 Groups and integrates deeply with:

a. SharePoint, Exchange, and OneDrive
b. Only Exchange Online
c. Only SharePoint lists

d. Only Power Automate

Answer: a. SharePoint, Exchange, and OneDrive.

Explanation: This integration provides a seamless experience for chat, meetings, calls, and app integrations.

24. To update Teams settings and policies, admins require which roles? **(Select all that apply)**

    a. Global administrator
    b. Teams administrator

    Answer: a, b.

    Explanation: Global administrator provides full access but should be used sparingly. Teams administrator manages team creation, policies, and app integrations.

25. Channels in Teams can be which types? **(Select all that apply)**

    a. Standard
    b. Private
    c. Shared

    Answer: a, b, c.

    Explanation: Channels organize conversations, files, and apps. Standard channels are open to all team members, private are restricted, and shared are across multiple teams.

26. Meeting policies in Teams define features available during meetings such as:

    a. Recording and transcription
    b. Only channel creation
    c. Only external sharing
    d. Only storage quotas

    Answer: a. Recording and transcription.

    Explanation: Administrators create policies in the Teams Admin Center and assign them to users or groups.

27. Tabs and connectors in Teams allow users to:

    a. Pin apps like SharePoint and Power BI within channels
    b. Only create private channels
    c. Only manage mailboxes
    d. Only configure retention policies

    Answer: a. Pin apps like SharePoint and Power BI within channels.

    Explanation: This provides quick access to resources and dashboards while connectors pull updates from external services.

28. Match each service with its primary configuration focus.

Service	**Primary Focus**
Exchange Online	Mailbox provisioning, mail flow rules, retention policies
SharePoint Online	Site provisioning, document libraries, permissions
Microsoft Teams	Team and channel management, meeting and messaging policies

Answer: Exchange Online → Mailbox provisioning, mail flow rules, retention policies; SharePoint Online → Site provisioning, document libraries, permissions; Microsoft Teams → Team and channel management, meeting and messaging policies.

Explanation: Each service has unique configuration requirements and best practices.

29. Scenario: A new employee joins the organization and is assigned an Exchange Online Plan 2 license. What happens to their mailbox?

    a. A mailbox with a 100-GB quota is automatically provisioned with advanced features like archiving and retention
    b. Only a shared mailbox is created
    c. No mailbox is created until manually provisioned in EAC
    d. Only a resource mailbox for equipment is created

    Answer: a. A mailbox with a 100-GB quota is automatically provisioned with advanced features like archiving and retention.

    Explanation: Assigning the license triggers automatic mailbox provisioning with the described quota and features.

30. Scenario: The helpdesk team needs to manage incoming support requests through a common email address. Which mailbox type should be used?

    a. Shared mailbox
    b. User mailbox
    c. Resource mailbox
    d. Archive mailbox only

    Answer: a. Shared mailbox.

    Explanation: Shared mailboxes allow multiple users to access and manage email from a common address such as support@contoso.com.

31. Scenario: An organization wants to automatically accept booking requests for Conference Room A. Which mailbox type and configuration should be used?

    a. Resource mailbox with automatic accept/decline based on availability
    b. Shared mailbox with manual approval only
    c. User mailbox assigned to the room owner
    d. Communication site with calendar web part

    Answer: a. Resource mailbox with automatic accept/decline based on availability.

    Explanation: Resource mailboxes are configured to automatically accept or decline meeting requests and enforce booking policies.

2.4

Establish security, identity, and compliance foundations

Abbreviation	Full Form
BYOD	Bring-your-own-device
MFA	Multifactor authentication
DLP	Data Loss Prevention
CA	Conditional Access

1. Securing Microsoft 365 environments begins with establishing strong identity controls, access policies, and compliance configurations. **(True/False)**

   Answer: True.

   Explanation: These foundational elements ensure that users, devices, and data are protected against unauthorized access and misuse.

2. The primary tools that Microsoft 365 admins use to configure baseline policies for device access, conditional access, and content protection include:

   a. Microsoft Entra, Microsoft Purview, and Microsoft Intune
   b. Only Microsoft Entra ID
   c. Only Microsoft Purview
   d. Only Microsoft Defender for Endpoint

   Answer: a. Microsoft Entra, Microsoft Purview, and Microsoft Intune.

   Explanation: These tools enable administrators to define and enforce security and compliance policies across Exchange Online, SharePoint Online, and Microsoft Teams.

3. Device access policies ensure that only trusted, compliant devices that meet the organization's security standards can connect to services like Exchange Online, SharePoint Online, and Teams. **(True/False)**

   Answer: True.

   Explanation: These policies are typically enforced using Microsoft Intune, which integrates with Microsoft Entra ID to evaluate device health and compliance status in real time.

4. Device compliance policies are configured in which service?

   a. Microsoft Purview
   b. Microsoft Intune
   c. Microsoft Entra admin center only
   d. Exchange admin center

   Answer: b. Microsoft Intune.

   Explanation: These policies define the minimum security standards a device must meet to be considered trustworthy.

5. Common requirements in device compliance policies include which of the following? **(Select all that apply)**

   a. Encryption
   b. Antivirus protection
   c. Minimum OS version

d. Password complexity

Answer: a, b, c, d.

Explanation: These settings ensure that only devices with a secure posture can access corporate resources.

6. Once a device meets all the defined criteria in Intune, it is marked as:

   a. Compliant
   b. Noncompliant
   c. Blocked
   d. Rooted

   Answer: a. Compliant.

   Explanation: This compliance status can then be used as a condition in Microsoft Entra ID conditional access policies.

7. Conditional access policies based on device state are configured in:

   a. Microsoft Intune
   b. Microsoft Entra ID
   c. Microsoft Purview
   d. SharePoint admin center

   Answer: b. Microsoft Entra ID.

   Explanation: These policies evaluate whether a device is compliant, hybrid Azure AD joined, or managed by Intune.

8. App protection policies operate at the app level and do not require full device enrollment. **(True/False)**

   Answer: True.

   Explanation: They are especially useful for unmanaged or bring-your-own-device scenarios.

9. A rooted device is a smartphone or tablet that was modified to gain privileged control over the operating system. **(True/False)**

   Answer: True.

   Explanation: Rooting allows users to bypass manufacturer and carrier restrictions but also disables many built-in security features.

10. A jailbroken device is a smartphone or tablet that was modified to remove manufacturer-imposed restrictions. **(True/False)**

    Answer: True.

    Explanation: Jailbreaking enables users to install unauthorized apps and bypass security controls.

11. Conditional access is a dynamic access control engine built into Microsoft Entra ID. **(True/False)**

    Answer: True.

    Explanation: It evaluates signals such as user identity, device compliance, location, and risk level to determine whether access should be granted, blocked, or limited.

12. In conditional access policies, administrators can target:

    a. Specific users or groups
    b. Cloud apps such as Exchange Online or Teams
    c. Conditions like sign-in risk or device platform
    d. All of the above

    Answer: d. All of the above.

    Explanation: Actions can include requiring MFA, blocking access, or applying session controls.

13. User and group targeting in conditional access policies allows administrators to apply different levels of access control based on roles, departments, or risk profiles. **(True/False)**

    Answer: True.

    Explanation: This granularity is essential for tailoring security policies to the needs of different user groups.

14. Sign-in risk evaluation uses signals from Microsoft Defender for Identity to detect anomalies such as:

    a. Unfamiliar locations
    b. Impossible travel
    c. Leaked credentials
    d. Malware indicators

    Answer: a, b, c, d. **(Select all that apply)**

    Explanation: Based on the assessed risk level, conditional access policies can enforce actions such as requiring MFA, blocking access, or prompting a password reset.

15. Session controls are enforced through:

    a. Microsoft Defender for Cloud Apps
    b. Microsoft Intune only
    c. Exchange transport rules
    d. SharePoint site permissions

    Answer: a. Microsoft Defender for Cloud Apps.

    Explanation: They can restrict activities such as downloading files, copying data, or printing documents.

16. Sensitivity labels are a core feature of:

    a. Microsoft Purview Information Protection
    b. Microsoft Intune
    c. Microsoft Entra ID
    d. Exchange Online

    Answer: a. Microsoft Purview Information Protection.

    Explanation: They allow organizations to classify and protect data across Microsoft 365 services by applying encryption, restricting access, and adding visual markings.

17. Data loss prevention (DLP) policies monitor and control the sharing of sensitive information using content inspection. **(True/False)**

    Answer: True.

    Explanation: They can block actions, notify users, or generate alerts for administrators across Outlook, SharePoint, and Teams.

18. Retention policies help organizations manage the lifecycle of their data by ensuring that content is preserved or deleted according to business and regulatory requirements. **(True/False)**

    Answer: True.

    Explanation: These policies can be applied to emails, documents, Teams messages, and more.

19. Which tool offers insights into DLP alerts, audit logs, and policy matches?

    a. Microsoft Purview portal
    b. Microsoft Entra admin center
    c. Intune reporting dashboards
    d. Exchange admin center

Answer: a. Microsoft Purview portal.

Explanation: Admins can investigate incidents, view user activity, and generate reports for compliance audits.

20. Match each tool with its primary monitoring capability.

Tool	Monitoring Capability
Microsoft Purview portal	DLP alerts, audit logs, and policy matches
Microsoft Entra admin center	Conditional access sign-ins and policy application
Intune reporting dashboards	Device compliance status and app protection enforcement

Answer: Microsoft Purview portal → DLP alerts, audit logs, and policy matches; Microsoft Entra admin center → Conditional access sign-ins and policy application; Intune reporting dashboards → Device compliance status and app protection enforcement.

Explanation: These tools provide visibility into policy effectiveness and potential violations.

21. A best practice when implementing security and compliance policies is to start with:

    a. A pilot group
    b. Organization-wide rollout immediately
    c. Disabling all policies
    d. Only using PowerShell

Answer: a. A pilot group.

Explanation: Testing in a controlled environment with a small, representative pilot group helps identify unintended consequences before full deployment.

22. Using built-in templates for DLP and conditional access helps accelerate deployment and reduce complexity. **(True/False)**

Answer: True.

Explanation: These templates provide tested configurations that align with industry standards.

23. Scenario: An organization wants to allow access to SharePoint Online from personal devices but prevent downloading or printing of documents. Which control should be used?

    a. Session controls through Microsoft Defender for Cloud Apps
    b. Device compliance policies only
    c. Retention policies
    d. Sensitivity labels only

Answer: a. Session controls through Microsoft Defender for Cloud Apps.

Explanation: This enables users to view content securely without risking data leakage.

24. Scenario: A user attempts to send an email containing a Social Security number to an external recipient. What happens if a DLP policy is active?

    a. The message is blocked and the user receives a notification
    b. The email is sent without restriction
    c. The message is automatically encrypted
    d. The policy only logs the attempt

Answer: a. The message is blocked and the user receives a notification.

Explanation: The incident is also logged in the Microsoft Purview portal for further review.

25. Scenario: An administrator notices repeated attempts to share sensitive HR documents through Teams from unmanaged devices. What action should be taken?

a. Tighten conditional access policies

b. Disable all DLP policies

c. Increase storage quotas

d. Remove sensitivity labels

Answer: a. Tighten conditional access policies.

Explanation: Proactive monitoring using audit logs helps maintain a secure and compliant environment.

26. Educating users on how policies work and why they matter is a critical component of successful policy implementation. **(True/False)**

    Answer: True.

    Explanation: When users understand sensitivity labels, DLP triggers, and access restrictions, they are more likely to comply.

2.5

Assign admin roles using Role-Based Access Control

Abbreviation	Full Form
RBAC	Role-Based Access Control
IT	Information Technology

1. In Microsoft 365, Role-Based Access Control provides a structured approach to distributing administrative responsibilities. **(True/False)**

   Answer: True.

   Explanation: RBAC ensures that each administrator only has the permissions necessary to perform their specific tasks while supporting operational efficiency and risk management.

2. RBAC in Microsoft 365 is built around the principle of least privilege. **(True/False)**

   Answer: True.

   Explanation: Least privilege means users and admins are granted only the access they need—nothing more, nothing less. This minimizes the risk of accidental or malicious changes and helps meet compliance requirements.

3. Role-Based Access Control restricts system access to authorized users based on their organizational role. **(True/False)**

   Answer: True.

   Explanation: In Microsoft 365, RBAC is implemented through a combination of built-in and custom admin roles, each with a defined set of permissions.

4. RBAC supports the separation of duties, which prevents any one individual from having unchecked power. **(True/False)**

   Answer: True.

   Explanation: For example, the person who approves financial transactions should not be the same person who processes them.

5. Which predefined admin role grants access to all Exchange-related settings without broader permissions over SharePoint or Teams?

   a. Global Administrator
   b. Teams Admin
   c. Exchange Admin
   d. Compliance Administrator

   Answer: c. Exchange Admin.

   Explanation: This role allows management of Exchange settings while preventing privilege creep into other services.

6. A Teams Admin can manage Teams policies and settings but cannot access:

   a. Exchange mailboxes or compliance features
   b. Only user accounts
   c. Only device management
   d. Only billing settings

Answer: a. Exchange mailboxes or compliance features.

Explanation: This targeted approach helps prevent unnecessary permissions.

7. Assigning predefined admin roles is the most common way to delegate administrative tasks in Microsoft 365. **(True/False)**

   Answer: True.

   Explanation: Microsoft provides a comprehensive set of built-in roles tailored to specific administrative functions.

8. Custom roles are especially useful when built-in roles are too broad or do not perfectly align with operational requirements. **(True/False)**

   Answer: True.

   Explanation: They allow organizations to define specific permissions tailored to unique business needs.

9. Key steps for creating and assigning custom roles include which of the following? **(Select all that apply)**

   a. Define permissions for the custom role
   b. Assign scope to the custom role
   c. Assign users or groups to the custom role

   Answer: a, b, c.

   Explanation: These steps support the principle of least privilege and help comply with regulatory requirements.

10. When defining permissions for a custom role, administrators should:

    a. Carefully review each permission to avoid granting unnecessary access
    b. Always include all write permissions
    c. Grant full Global Administrator rights
    d. Skip scoping

    Answer: a. Carefully review each permission to avoid granting unnecessary access.

    Explanation: For example, a role might allow viewing audit logs but exclude all write or modify permissions.

11. Assigning scope to a custom role limits the role's permissions to:

    a. Specific groups, departments, or resources
    b. The entire tenant only
    c. Only Exchange Online
    d. Only SharePoint sites

    Answer: a. Specific groups, departments, or resources.

    Explanation: This is especially important in large organizations where different teams have distinct responsibilities.

12. Using groups for role assignment rather than individuals:

    a. Streamlines management and reduces the risk of orphaned permissions
    b. Increases manual effort
    c. Prevents automatic updates when users leave
    d. Is not recommended

    Answer: a. Streamlines management and reduces the risk of orphaned permissions.

    Explanation: When a user joins or leaves a group, their role assignments are automatically updated.

13. Regularly reviewing role assignments helps identify and remove:

    a. Unnecessary or outdated permissions

b. Only Global Administrator roles
c. Only custom roles
d. All user accounts

Answer: a. Unnecessary or outdated permissions.

Explanation: This proactive approach reduces the risk of privilege creep.

14. Documenting role definitions and assignments supports:

    a. Transparency and compliance
    b. Only faster role creation
    c. Only PowerShell scripting
    d. Removing all monitoring

    Answer: a. Transparency and compliance.

    Explanation: Documentation should include the purpose of the role, assigned users or groups, and any relevant policies.

15. Which tool provides comprehensive audit logs of role changes and admin activities?

    a. Microsoft Purview portal
    b. Exchange admin center only
    c. Teams admin center only
    d. SharePoint admin center

    Answer: a. Microsoft Purview portal.

    Explanation: Regularly reviewing these logs helps detect unauthorized changes and demonstrate compliance during audits.

16. The Microsoft Entra Admin Center is used to:

    a. Track current role assignments and access patterns
    b. Only create mailboxes
    c. Only manage SharePoint sites
    d. Only configure DLP policies

    Answer: a. Track current role assignments and access patterns.

    Explanation: It offers detailed views of who has admin roles and when assignments were made.

17. Setting up automated alerts for critical role changes enables:

    a. Rapid response to potential security threats
    b. Automatic deletion of all roles
    c. Disabling of audit logs
    d. Removal of least privilege principle

    Answer: a. Rapid response to potential security threats.

    Explanation: Alerts can be configured for assignments or removals of high-risk roles such as Global Admin or Compliance Admin.

18. Match each best practice with its primary benefit.

Best Practice	**Primary Benefit**
Use groups for role assignment	Automatic updates when users join or leave
Regularly review role assignments	Reduces privilege creep
Document role definitions	Supports transparency and compliance
Start with a pilot group	Identifies issues before full deployment

Answer: Use groups for role assignment → Automatic updates when users join or leave; Regularly review role assignments → Reduces privilege creep; Document role definitions → Supports transparency and compliance; Start with a pilot group → Identifies issues before full deployment.

Explanation: These practices ensure secure and effective RBAC implementation.

19. Scenario: A contractor needs read-only access to user profiles but should not modify any settings. What should be created?

    a. A custom role in Microsoft Entra ID
    b. The Global Administrator role
    c. The Exchange Admin role
    d. A Teams Admin role

    Answer: a. A custom role in Microsoft Entra ID.

    Explanation: Custom roles allow selection of only the exact permissions required for the contractor's tasks.

20. Scenario: After a critical issue is resolved, a helpdesk admin's elevated permissions should be:

    a. Revoked as soon as the task is complete
    b. Left active for 30 days
    c. Converted to Global Administrator
    d. Assigned to all users

    Answer: a. Revoked as soon as the task is complete.

    Explanation: Secure delegation requires that permissions granted thoughtfully are monitored and revoked when no longer needed.

21. Educating users on role management and the importance of least privilege fosters a culture of security and compliance. **(True/False)**

    Answer: True.

    Explanation: Training helps admins and users understand how to request, assign, and remove roles while emphasizing the risks of over-privileging.

3

Protect and govern Microsoft 365 data

3.1

Introduction to Microsoft Purview and data governance

Abbreviation	Full Form
GDPR	General Data Protection Regulation
HIPAA	Health Insurance Portability and Accountability Act
SOX	Sarbanes-Oxley Act
DLP	Data Loss Prevention
DSPM	Data Security Posture Management
DLM	Data Lifecycle Management
EDM	Exact Data Match
SIT	Sensitive Information Type

1. Microsoft Purview is Microsoft's unified solution for data governance, information protection, and compliance management across Microsoft 365 and beyond. **(True/False)**

   Answer: True.

   Explanation: Purview helps administrators automatically discover sensitive data, classify it based on risk or compliance needs, apply labels and protection settings, and control the entire lifecycle of data.

2. Microsoft Purview's features fall into three primary categories. What are they?

   Answer: Data security, data governance, and risk and compliance.

   Explanation: These three areas address visibility, control, and accountability over sensitive and regulated data.

3. Which capability in Microsoft Purview empowers organizations to classify, label, and encrypt sensitive data across emails, documents, and collaboration platforms?

   Answer: Information Protection.

   Explanation: Sensitivity labels, applied manually or automatically, ensure that confidential information is consistently protected, with controls that travel with the data.

4. Data Loss Prevention in Purview helps prevent the accidental or intentional sharing of sensitive information by scanning content for predefined patterns. **(True/False)**

   Answer: True.

   Explanation: DLP policies can block risky actions, notify users, and alert administrators across Microsoft 365 workloads.

5. Insider Risk Management in Purview uses behavioral analytics to detect and mitigate internal threats. **(True/False)**

   Answer: True.

   Explanation: It monitors user activities for unusual or risky behavior and supports collaboration between IT, HR, and legal teams.

6. Communications Compliance in Purview monitors and manages communications across email, Teams, and Yammer. **(True/False)**

   Answer: True.

   Explanation: It scans messages for inappropriate language, sensitive topics, or policy violations to maintain a safe, compliant, and respectful workplace.

7. DSPM for AI in Purview provides visibility and control over sensitive data used by artificial intelligence systems. **(True/False)**

   Answer: True.

   Explanation: It helps organizations discover, classify, and secure data flows in AI workloads while enforcing policies for responsible AI development.

8. Data Lifecycle Management automates the retention, archiving, and deletion of data based on business, legal, or regulatory requirements. **(True/False)**

   Answer: True.

   Explanation: Through retention labels and policies, Purview ensures that information is kept only as long as necessary, reducing risk and storage costs.

9. Data discovery and classification are foundational capabilities that enable administrators to understand what kind of data exists, where it resides, and how sensitive it is. **(True/False)**

   Answer: True.

   Explanation: Without visibility into the data landscape, it is impossible to apply meaningful protection or retention policies.

10. Purview uses a combination of pattern recognition, AI-based machine learning, and metadata inspection to classify data. **(True/False)**

    Answer: True.

    Explanation: Classification can happen manually by user selection, automatically based on policy rules, or through trainable classifiers.

11. Which of the following is a predefined sensitive information type in Purview? **(Select all that apply)**

    a. Credit card numbers

    b. Social Security numbers

    c. Health Insurance Claim Numbers

    d. U.S. or international passport numbers

    Answer: a, b, c, d.

    Explanation: These information types are recognized using regex patterns, checksums, keyword evidence, and confidence scoring.

12. Trainable classifiers are machine learning-based models that you train with examples of documents that fall into a specific category. **(True/False)**

    Answer: True.

    Explanation: Microsoft includes built-in classifiers such as Resumes, Source code, and Healthcare templates. Custom classifiers can be built by uploading at least 50 sample documents.

13. Exact Data Match (EDM) checks if the data exactly matches entries in a secure list that your organization provides. **(True/False)**

    Answer: True.

    Explanation: EDM offers greater precision than pattern-based tools and reduces false positives by matching against a secure, predefined dataset.

14. Sensitivity labels allow you to classify and protect data based on its sensitivity level. **(True/False)**

    Answer: True.

    Explanation: Once applied, they can enforce encryption, restrict access, add visual markings, and control external sharing. The protection travels with the data.

15. Sensitivity labels can be applied in which ways? **(Select all that apply)**

    a. Manually by users

b. Automatically based on content detection

c. As recommended suggestions to users

Answer: a, b, c.

Explanation: Administrators can also enforce mandatory labeling.

16. Which components can be included in sensitivity labels? **(Select all that apply)**

    a. Encryption settings

    b. Content markings

    c. Access restrictions and sharing controls

    Answer: a, b, c.

    Explanation: Encryption restricts who can open, read, edit, print, or copy. Content markings include headers, footers, and watermarks. Access restrictions control external sharing and unmanaged devices.

17. Label policies determine which labels are available to which users or groups and whether labeling is mandatory. **(True/False)**

    Answer: True.

    Explanation: Policies can require justification for changing labels from more restrictive to less restrictive ones.

18. Data Lifecycle Management ensures that information is retained for as long as it is needed and no longer. **(True/False)**

    Answer: True.

    Explanation: It is vital for compliance, reducing data risk, saving storage costs, and simplifying eDiscovery processes.

19. Retention labels define the retention behavior for specific content. **(True/False)**

    Answer: True.

    Explanation: A retention label might retain content for a fixed period, delete it after a specified number of days, or retain and then delete.

20. Retention policies are broader than labels and are typically used to apply rules across locations or content types. **(True/False)**

    Answer: True.

    Explanation: They are location-based and useful for uniform rules across users or unlabeled content.

21. Auto-apply rules for retention labels use which of the following? **(Select all that apply)**

    a. Keywords or phrases

    b. Sensitive information types

    c. Trainable classifiers

    Answer: a, b, c.

    Explanation: These rules remove reliance on users to apply the correct label, improving consistency and compliance.

22. Scenario: A document containing employee Social Security numbers is uploaded to OneDrive. What feature in Purview would detect this using exact values from an uploaded list?

    a. Exact Data Match (EDM)

    b. Trainable classifier only

    c. Regex pattern only

    d. Manual labeling only

Answer: a. Exact Data Match (EDM).

Explanation: EDM checks for exact matches against a secure list provided by the organization, reducing false positives.

23. Scenario: An organization wants to automatically retain all contracts for 7 years and then delete them. Which Purview feature should be used?

    a. Retention label with auto-apply rule
    b. Only sensitivity label
    c. Only DLP policy
    d. Manual deletion by users

    Answer: a. Retention label with auto-apply rule.

    Explanation: The label can be automatically applied based on content conditions such as keywords or sensitive information types.

3.2

Identify and respond to data risks with Microsoft Purview

Abbreviation	Full Form
DLP	Data Loss Prevention
AI	Artificial Intelligence
FINRA	Financial Industry Regulatory Authority
HIPAA	Health Insurance Portability and Accountability Act
MNPI	Material Nonpublic Information
SIEM	Security Information and Event Management

1. Modern IT environments require tools that deliver real-time, contextual insights into how data is used, moved, and shared across cloud, endpoint, and user interaction layers. **(True/False)**

   Answer: True.

   Explanation: Traditional security controls such as firewalls and static access policies are no longer sufficient to address evolving data risks.

2. Microsoft Purview provides a unified platform for managing compliance, data protection, and insider risk through tools such as Insider Risk Management, Data Loss Prevention, Communication Compliance, and Activity Explorer. **(True/False)**

   Answer: True.

   Explanation: These tools work together to provide visibility and control across Microsoft 365 workloads, devices, and AI services like Copilot.

3. Governance risks emerge when sensitive information is accessed, shared, or used in ways that contradict company policy or regulatory obligations. **(True/False)**

   Answer: True.

   Explanation: Microsoft Purview detects these risks by analyzing signals across Microsoft 365 apps including SharePoint, OneDrive, Teams, and Copilot.

4. Monitoring risk signals in Microsoft Purview includes which of the following? **(Select all that apply)**

   a. Policy violations

   b. Suspicious user behavior

   c. Unauthorized data access or movement

   Answer: a, b, c.

   Explanation: These risk signals are presented in the Microsoft Purview portal to help administrators detect early signs of misbehavior or misconfiguration.

5. Data exfiltration refers to the unauthorized movement of sensitive data from within an organization to external locations. **(True/False)**

   Answer: True.

   Explanation: Purview surfaces these activities through behavioral analytics such as detecting mass downloads from SharePoint or OneDrive.

6. Microsoft Purview can restrict Copilot from processing or displaying certain labeled documents through Data Loss Prevention policies. **(True/False)**

   Answer: True.

Explanation: If a user tries to use Copilot in a way that violates these policies, Purview logs the activity and can issue warnings or block the action entirely.

7. Detecting sudden spikes in sensitive data access can be early indicators of account compromise or insider threats. **(True/False)**

   Answer: True.

   Explanation: Purview continuously monitors baseline user behavior and flags deviations that exceed expected norms.

8. Insider Risk Management analyzes user activity in the context of defined thresholds, HR signals, and behavioral baselines. **(True/False)**

   Answer: True.

   Explanation: It combines machine learning, user activity data, and security signals to flag anomalies that could indicate potential misuse.

9. Which behavior can Insider Risk Management detect as a potential indicator of data theft? **(Select all that apply)**

   a. Mass file downloads of sensitive content
   b. Sharing data to personal email accounts
   c. Abnormal access during non-working hours or unusual travel locations

   Answer: a, b, c.

   Explanation: Policies can watch for downloading more than a defined number of confidential files, sending to personal domains, or access outside normal patterns.

10. Integrating HR signals such as resignation notices or role changes with behavioral thresholds makes Insider Risk Management more effective. **(True/False)**

    Answer: True.

    Explanation: The combination of HR context and data activity elevates risk scores and justifies further investigation during high-risk periods.

11. Data Loss Prevention policies in Purview can be configured to block uploading of Confidential documents to non-Microsoft cloud services. **(True/False)**

    Answer: True.

    Explanation: Users might be permitted to proceed after providing a business justification, which is then logged for audit purposes.

12. Purview DLP integrates with Microsoft Defender for Endpoint to enforce policies at the device level. **(True/False)**

    Answer: True.

    Explanation: It can block or log actions such as copying files to USB drives, printing sensitive documents, or using clipboard tools on onboarded devices.

13. When a DLP rule is triggered, Purview generates an alert containing details such as who triggered it, when, what data was involved, and which rule was violated. **(True/False)**

    Answer: True.

    Explanation: These alerts can be routed to Microsoft Defender XDR, Microsoft Sentinel, or other SIEM tools and can trigger automated workflows.

14. Communication Compliance helps monitor user communications across email, Teams messages, Yammer posts, and Copilot chat prompts. **(True/False)**

    Answer: True.

    Explanation: It detects content that violates corporate policies or regulatory requirements using pattern-based detection and machine learning classifiers.

15. The Communication Compliance reviewer dashboard allows analysts to assess flagged messages, dismiss events, send notifications, or escalate to HR or legal. **(True/False)**

    Answer: True.

    Explanation: This human-in-the-loop process supports context-aware decisions and policy tuning.

16. Activity Explorer in Microsoft Purview provides a consolidated view of user activity across Microsoft 365 including labeling, sharing, downloads, and DLP matches. **(True/False)**

    Answer: True.

    Explanation: It serves as a forensic timeline that helps correlate actions and investigate incidents efficiently.

17. Activity Explorer supports powerful filters by which of the following? **(Select all that apply)**

    a. User
    b. Policy
    c. Date
    d. File type
    e. Sensitivity label

    Answer: a, b, c, d, e.

    Explanation: These filters allow investigators to drill into specific activity types and examine relevant subsets of actions.

18. Scenario: A user suddenly downloads 75 confidential documents in a single day during off-hours. Which Purview feature would most likely flag this behavior?

    a. Insider Risk Management
    b. Only Communication Compliance
    c. Only Activity Explorer without policies
    d. Manual audit only

    Answer: a. Insider Risk Management.

    Explanation: Policies can detect mass downloads of sensitive files and generate alerts based on defined thresholds.

19. Scenario: An employee sends a document labeled Confidential to a personal Gmail address. What combination of Purview tools would best detect and respond to this?

    a. DLP policy combined with Insider Risk Management
    b. Only sensitivity labels
    c. Only Activity Explorer
    d. Communication Compliance alone

    Answer: a. DLP policy combined with Insider Risk Management.

    Explanation: DLP can block or alert on sharing to personal domains while Insider Risk Management provides behavioral context.

20. Scenario: A compliance analyst needs to reconstruct the full sequence of events for a document that was labeled, downloaded, and then shared externally. Which tool provides the best timeline view?

    a. Activity Explorer
    b. Insider Risk Management dashboard only
    c. DLP alert list
    d. Communication Compliance reviewer

    Answer: a. Activity Explorer.

    Explanation: It organizes actions into linked timelines with deep context including timestamps, user identity, device info, and label history.

3.3

Examine compliance, AI data discovery, and eDiscovery

Abbreviation	Full Form
GDPR	General Data Protection Regulation
HIPAA	Health Insurance Portability and Accountability Act
ISO 27001	International Organization for Standardization 27001
DLP	Data Loss Prevention
DSPM	Data Security Posture Management
KQL	Keyword Query Language
GUI	Graphical User Interface

1. Microsoft Purview offers a unified platform for managing compliance, discovering sensitive and AI-impacted data, and executing legal holds and investigations. **(True/False)**

   Answer: True.

   Explanation: Admins use Purview's advanced capabilities to assess compliance posture, gain visibility into data usage, and support governance as AI-driven workflows become more prevalent.

2. Compliance Manager acts as a risk assessment and recommendations engine for navigating complex regulatory landscapes. **(True/False)**

   Answer: True.

   Explanation: It helps organizations evaluate their current compliance status, identify gaps, and implement targeted improvements for regulations such as GDPR, HIPAA, and ISO 27001.

3. The Compliance Score in Compliance Manager quantifies how well an organization meets regulatory requirements. **(True/False)**

   Answer: True.

   Explanation: This score is a strategic tool for prioritizing remediation efforts and demonstrating progress to stakeholders.

4. Assessments in Compliance Manager are composed of controls that are either Microsoft-managed or customer-managed. **(True/False)**

   Answer: True.

   Explanation: Microsoft-managed controls are automatically monitored, while customer-managed controls require manual verification and evidence upload.

5. Improvement actions in Compliance Manager are specific steps recommended to close compliance gaps. **(True/False)**

   Answer: True.

   Explanation: These actions might include enabling auditing, assigning sensitivity labels, or updating privacy notices, and can be assigned to owners for tracking.

6. Data Explorer helps admins discover where sensitive data resides across emails, documents, chats, and cloud storage. **(True/False)**

   Answer: True.

   Explanation: It provides powerful tools to visualize, filter, and analyze sensitive information across SharePoint, Teams, OneDrive, and other locations.

7. Data Explorer allows filtering by which of the following? **(Select all that apply)**

a. Location

b. Sensitivity label

c. Content type

Answer: a, b, c.

Explanation: These filters help admins quickly pinpoint areas of concern and assess data exposure risks.

8. DSPM for AI enables admins to discover, monitor, and control how AI interacts with sensitive data. **(True/False)**

   Answer: True.

   Explanation: It tracks AI-generated content, detects interactions with sensitive data, and identifies shadow AI usage.

9. Shadow AI usage refers to the unsanctioned or unauthorized use of AI tools by employees without formal approval or oversight. **(True/False)**

   Answer: True.

   Explanation: It creates risks for security, compliance, and operational efficiency similar to shadow IT.

10. DSPM for AI can detect AI interactions such as Copilot summarizing legal contracts or generating reports based on regulated information. **(True/False)**

    Answer: True.

    Explanation: Admins can define rules to prevent AI from accessing certain content types and mitigate risks through encryption or access controls.

11. Reporting features within DSPM for AI include Activity Explorer views, audit logs, oversharing assessments, and data risk assessment reports. **(True/False)**

    Answer: True.

    Explanation: These tools provide centralized visibility into how sensitive data is accessed, processed, and exposed across AI-driven workflows.

12. Content Search in Microsoft Purview enables admins to search across mailboxes, SharePoint sites, OneDrive, and Teams using keywords, sender information, dates, and sensitivity labels. **(True/False)**

    Answer: True.

    Explanation: It supports both Keyword Query Language and graphical user interface filters for locating relevant information.

13. eDiscovery in Microsoft Purview is available in which two editions?

    a. Standard and Premium

    b. Basic and Advanced

    c. Cloud and On-premises

    d. Free and Enterprise

    Answer: a. Standard and Premium.

    Explanation: eDiscovery (Standard) offers basic search, export, and legal hold features, while eDiscovery (Premium) adds advanced capabilities such as case management, review sets, analytics, and redaction.

14. Legal hold prevents data from being altered or deleted during an investigation. **(True/False)**

    Answer: True.

    Explanation: It ensures that all relevant communications and files remain available for review in legal cases.

15. Match each Microsoft Purview tool with its primary function.

Tool	Primary Function
Compliance Manager	Risk assessment, Compliance Score, and improvement actions
Data Explorer	Discover and visualize sensitive data locations
DSPM for AI	Monitor AI interactions and shadow AI usage
eDiscovery (Premium)	Advanced case management, analytics, and redaction

Answer: Compliance Manager → Risk assessment, Compliance Score, and improvement actions; Data Explorer → Discover and visualize sensitive data locations; DSPM for AI → Monitor AI interactions and shadow AI usage; eDiscovery (Premium) → Advanced case management, analytics, and redaction.

Explanation: Each tool addresses specific aspects of compliance, data discovery, AI governance, and legal investigations.

16. Scenario: An organization needs to evaluate gaps in GDPR compliance and track remediation actions. Which tool should be used?

    a. Compliance Manager

    b. Data Explorer only

    c. DSPM for AI only

    d. Content Search

    Answer: a. Compliance Manager.

    Explanation: It provides prebuilt assessments, controls, improvement actions, and a Compliance Score tailored to regulations like GDPR.

17. Scenario: An admin wants to locate all documents containing credit card numbers that are shared externally. Which tool provides the best visibility?

    a. Data Explorer

    b. Compliance Manager

    c. eDiscovery (Standard)

    d. Communication Compliance

    Answer: a. Data Explorer.

    Explanation: It scans for sensitive information types, applies filters by sensitivity label and sharing status, and shows owners and exposure risks.

18. Scenario: A legal team requires advanced analytics, review sets, and redaction capabilities for a complex investigation. Which eDiscovery edition should be used?

    a. eDiscovery (Premium)

    b. eDiscovery (Standard)

    c. Content Search only

    d. Compliance Manager

    Answer: a. eDiscovery (Premium).

    Explanation: Premium adds case management, analytics such as near-duplicate identification, and redaction features.

3.4

Explore oversharing and data access governance in SharePoint

Abbreviation	Full Form
SAM	SharePoint Advanced Management
DAG	Data Access Governance

1. Oversharing in SharePoint Online occurs when users grant broader access to content than is appropriate or intended. **(True/False)**

   Answer: True.

   Explanation: It can happen by sharing documents with Everyone or Anyone with the link, providing edit access when view-only is sufficient, or allowing external guest users full site access.

2. The risks associated with oversharing include compliance, privacy, and security threats. **(True/False)**

   Answer: True.

   Explanation: When sensitive or regulated data is exposed to unauthorized users, organizations face these threats, which are amplified when users are unaware of the consequences.

3. Common oversharing scenarios include which of the following? **(Select all that apply)**

   a. Sharing with Everyone or Anyone with the link

   b. Providing Edit access instead of View-only

   c. Allowing external guest users full site access

   Answer: a, b, c.

   Explanation: These actions can lead to unintended disclosure of proprietary information, unauthorized changes, or exposure of all site content.

4. Sharing reports in the Microsoft 365 Admin Center and SharePoint Admin Center give visibility into who shared what, who has access, and the status of external sharing. **(True/False)**

   Answer: True.

   Explanation: These reports can be filtered by site, folder, or file to pinpoint risky sharing events.

5. PowerShell and Microsoft Graph API enable admins to audit access at scale and identify documents shared with Anyone with the link or containing sensitive labels. **(True/False)**

   Answer: True.

   Explanation: Automated scripts and alerts help detect high-risk sharing and ensure timely intervention.

6. Sensitivity labels with encryption limit who can open or download shared files. **(True/False)**

   Answer: True.

   Explanation: A confidential HR report labeled with encryption can only be opened by members of the HR team even if the link is shared externally.

7. Organization-wide sharing limits can disable anonymous links and enforce stricter sharing policies. **(True/False)**

   Answer: True.

   Explanation: This prevents users from creating anonymous links or sharing content with broad audiences.

8. Data Access Governance (DAG) reports provide insights into sites with sensitive content and excessive sharing, sites where owners are inactive, and sites lacking assigned sensitivity labels. **(True/False)**

   Answer: True.

   Explanation: These reports help admins identify high-risk sites and guide remediation efforts such as revoking guest access or applying sensitivity labels.

9. SharePoint Advanced Management (SAM) provides advanced governance features including restricted site access, inactivity alerts, and site access reviews. **(True/False)**

   Answer: True.

   Explanation: It is designed for organizations requiring granular control over site access, activity monitoring, and integration with conditional access policies.

10. Restricted site access in SAM ensures that only authorized users and compliant devices can connect to sites containing sensitive data. **(True/False)**

    Answer: True.

    Explanation: For example, a finance team's site might be configured to allow access only from devices managed by Intune.

11. Inactivity alerts in SAM detect sites that have not been accessed for a defined period. **(True/False)**

    Answer: True.

    Explanation: This helps prevent abandoned sites from becoming security liabilities by flagging them for review or automatic restriction.

12. Site access reviews prompt site owners to periodically review and confirm permissions. **(True/False)**

    Answer: True.

    Explanation: This ensures that access remains appropriate over time and outdated permissions are removed.

13. Match each governance feature with its primary benefit.

Feature	**Primary Benefit**
Sensitivity labels and encryption	Restricts access to authorized users only
Organization-wide sharing limits	Prevents anonymous links and broad sharing
DAG reports	Identifies high-risk sites for remediation
SAM restricted site access	Limits access to authorized users and compliant devices
SAM inactivity alerts	Flags unused sites to reduce security risks

    Answer: Sensitivity labels and encryption → Restricts access to authorized users only; Organization-wide sharing limits → Prevents anonymous links and broad sharing; DAG reports → Identifies high-risk sites for remediation; SAM restricted site access → Limits access to authorized users and compliant devices; SAM inactivity alerts → Flags unused sites to reduce security risks.

    Explanation: These features work together to balance collaboration with data protection.

14. Scenario: A confidential contract was shared externally with Anyone with the link. What should an admin do first?

    a. Use sharing reports or DAG reports to confirm and revoke access
    b. Ignore it if no one complained
    c. Disable all external sharing permanently
    d. Ask the user to delete the file

    Answer: a. Use sharing reports or DAG reports to confirm and revoke access.

    Explanation: These tools help identify risky sharing events and enable targeted remediation such as revoking guest access.

15. Scenario: An organization wants to prevent users from sharing sensitive documents anonymously. Which control is most effective?

    a. Organization-wide sharing limits to disable anonymous links
    b. Only user education
    c. Only PowerShell scripts
    d. Removing all sensitivity labels

    Answer: a. Organization-wide sharing limits to disable anonymous links.

    Explanation: This enforces stricter sharing policies at the organizational level and reduces the risk of accidental exposure.

3.5

Explore data protection in Microsoft 365 Copilot

Abbreviation	Full Form
DLP	Data Loss Prevention
AI	Artificial Intelligence

1. Microsoft 365 Copilot helps users work more efficiently with content stored across Microsoft 365 services. **(True/False)**

   Answer: True.

   Explanation: It introduces generative AI features across Word, Excel, Outlook, Teams, SharePoint, and OneDrive.

2. Copilot inherits the same access controls and restrictions as the authenticated user. **(True/False)**

   Answer: True.

   Explanation: One of the most common misconceptions that Copilot sees everything or can leak information between users is not true.

3. Copilot accesses data through Microsoft Graph using the identity and permissions of the currently signed-in user. **(True/False)**

   Answer: True.

   Explanation: It operates entirely within Microsoft Purview compliance boundaries and does not transmit data outside the tenant.

4. Copilot can only access information that the user already has permission to see. **(True/False)**

   Answer: True.

   Explanation: If a user cannot open a document manually, Copilot cannot interact with that content on their behalf.

5. Which Microsoft 365 services does Copilot access data from? **(Select all that apply)**

   a. Outlook

   b. Word, Excel, and PowerPoint

   c. Teams

   d. OneDrive and SharePoint

   Answer: a, b, c, d.

   Explanation: Copilot can summarize emails, generate content in Office apps, summarize meetings in Teams, and retrieve content from cloud storage repositories the user has permission to access.

6. Microsoft Graph is the centralized data access layer for the entire Microsoft 365 ecosystem. **(True/False)**

   Answer: True.

   Explanation: Everything from reading calendars to retrieving SharePoint documents is done through Graph APIs, and it is the only way Copilot accesses and interprets user data.

7. Microsoft Graph uses semantic understanding to interpret the meaning behind words, phrases, and data. **(True/False)**

   Answer: True.

   Explanation: It builds a semantic index using embeddings to recognize similar ideas, understand organizational jargon, and retrieve contextually relevant results.

8. Copilot's security model respects which of the following? **(Select all that apply)**

   a. Sensitivity Labels
   b. Data Loss Prevention policies
   c. Conditional Access policies
   d. Information Protection policies

   Answer: a, b, c, d.

   Explanation: Copilot does not bypass or circumvent any existing security models and obeys these policies during data retrieval and response generation.

9. If a document is labeled "Highly Confidential" and restricted to a specific group, Copilot excludes it from analysis unless the user has permission. **(True/False)**

   Answer: True.

   Explanation: Copilot respects sensitivity labels and does not surface or use labeled content in responses if policy rules prevent it.

10. Link-based sharing in Copilot follows the same rules as manual access. **(True/False)**

    Answer: True.

    Explanation: If a sharing link expires or is revoked, Copilot access to that content disappears as well.

11. Responsible AI principles in Copilot include data minimization, transparency, content filtering, and auditability. **(True/False)**

    Answer: True.

    Explanation: These principles ensure safe, ethical, and auditable use of AI.

12. Data minimization in Copilot means it retrieves only the data necessary to fulfill a specific user request. **(True/False)**

    Answer: True.

    Explanation: It does not indiscriminately crawl through user mailboxes or file systems.

13. When Copilot generates a response, it provides links to the source files used. **(True/False)**

    Answer: True.

    Explanation: This transparency enables users to verify the response and ensures accountability.

14. All Copilot interactions are logged for auditing. **(True/False)**

    Answer: True.

    Explanation: Admins can view these logs using Microsoft Purview and Microsoft 365 audit logs.

15. Scenario: A user in the Marketing department asks Copilot to summarize a finance report stored in a SharePoint folder restricted to the Finance team. What should happen?

    a. Copilot indicates that no such file can be found
    b. Copilot summarizes the report anyway
    c. Copilot asks for Finance team permission
    d. Copilot creates a new summary from memory

    Answer: a. Copilot indicates that no such file can be found.

    Explanation: Copilot can only access information that the user already has permission to see.

16. Scenario: An admin wants to ensure Copilot cannot process Highly Confidential documents. Which controls should be configured?

    a. Sensitivity Labels and DLP policies in Microsoft Purview
    b. Only Conditional Access
    c. Only Microsoft Graph settings

d. Only audit logging

Answer: a. Sensitivity Labels and DLP policies in Microsoft Purview.

Explanation: Copilot respects these policies and will not surface or use labeled content if rules prevent it.

4

Explore Microsoft 365 Copilot and agent administration

4.1

Introduction to Microsoft 365 Copilot

Abbreviation	Full Form
LLM	Large Language Model

1. Microsoft 365 Copilot is a generative AI-powered assistant embedded directly into apps like Word, Excel, PowerPoint, Outlook, and Teams. **(True/False)**

   Answer: True.

   Explanation: It operates inside the organization's Microsoft 365 tenant and can only use data the signed-in user already has permission to access.

2. Copilot ensures its outputs are both intelligent and contextually relevant by grounding responses in real organizational data. **(True/False)**

   Answer: True.

   Explanation: It uses data from files, chats, emails, calendars, and other content connected through Microsoft Graph.

3. Microsoft 365 Copilot combines three key components. What are they?

   Answer: Microsoft Graph for secure data connectivity, an orchestration service to manage prompts and rules, and large language models that generate natural language responses.

   Explanation: These components make Copilot a powerful productivity tool while raising important considerations for governance, security, and compliance.

4. Microsoft 365 Copilot is not a single standalone app but a collection of intelligent capabilities built directly into Microsoft 365 applications. **(True/False)**

   Answer: True.

   Explanation: These capabilities are powered by Microsoft Graph, an orchestration service, large language models, and Work IQ.

5. Microsoft Graph acts as the backbone of Microsoft 365 Copilot's intelligence. **(True/False)**

   Answer: True.

   Explanation: It serves as a unified data layer that connects information from across Microsoft 365 services into a single, secure framework.

6. Work IQ helps Copilot understand how work actually happens across an organization. **(True/False)**

   Answer: True.

   Explanation: It learns patterns, relationships, workflows, and preferences to deliver personalized, relevant, and aligned responses.

7. Microsoft Graph uses semantic understanding rather than just keyword matching. **(True/False)**

   Answer: True.

   Explanation: It recognizes related concepts and returns contextually relevant results based on meaning.

8. Relationship mapping in Microsoft Graph shows connections between people, files, and activities. **(True/False)**

   Answer: True.

   Explanation: It enables Copilot to answer nuanced questions by understanding who contributed to documents and what feedback was provided.

9. Large language models serve as the reasoning engine behind Copilot. **(True/False)**

   Answer: True.

   Explanation: They interpret prompts and generate natural, human-like responses while operating in a tenant-isolated environment.

10. Copilot's large language models are hosted in Microsoft's Azure OpenAI Service and are fine-tuned for enterprise use cases. **(True/False)**

    Answer: True.

    Explanation: They ensure outputs are context-aware and compliant, with data never leaking into public training sets.

11. Copilot is embedded directly into Microsoft 365 apps, allowing users to interact with it through tools they already know. **(True/False)**

    Answer: True.

    Explanation: This native integration makes Copilot an intuitive, everyday assistant that supports cross-app orchestration.

12. The orchestration service manages how user prompts, Microsoft Graph data, and the large language model interact. **(True/False)**

    Answer: True.

    Explanation: It acts as a traffic controller that evaluates, enriches, and formats requests while applying compliance checks.

13. The lifecycle of a Copilot prompt includes grounding with contextual data from Microsoft Graph and advanced indexing. **(True/False)**

    Answer: True.

    Explanation: This ensures the large language model has the necessary context to produce meaningful and relevant results.

14. Copilot respects existing security and compliance boundaries, including role-based access control, sensitivity labels, and conditional access policies. **(True/False)**

    Answer: True.

    Explanation: It cannot access or expose data that the user does not already have permission to see.

15. Scenario: A user without access to a confidential finance report asks Copilot to summarize it. What should happen?

    a. Copilot indicates that no such file can be found or accessed
    b. Copilot summarizes the report using public knowledge
    c. Copilot requests elevated permissions
    d. Copilot creates a generic summary

    Answer: a. Copilot indicates that no such file can be found or accessed.

    Explanation: Copilot only uses data the signed-in user already has permission to access through Microsoft Graph.

16. Scenario: An organization wants Copilot to generate a project proposal based on recent meetings and documents. Which component primarily enables this contextual retrieval?

    a. Microsoft Graph and Work IQ
    b. Only the large language model
    c. Only the orchestration service
    d. User education modules

    Answer: a. Microsoft Graph and Work IQ.

    Explanation: Graph provides the data connectivity and relationship mapping while Work IQ adds intelligence about how work happens in the organization.

4.2

What are agents?

Abbreviation	Full Form
AI	Artificial Intelligence

1. Agents are intelligent software tools in Microsoft 365 that help users work more efficiently. **(True/False)**

   Answer: True.

   Explanation: They can automate routine tasks, answer questions, and provide personalized recommendations.

2. Agents in Microsoft 365 use artificial intelligence and machine learning to understand user behavior and preferences. **(True/False)**

   Answer: True.

   Explanation: This allows them to deliver tailored solutions that adapt to individual needs and simplify everyday work.

3. What sets agents apart from a personal assistant is that they can be tailored to have a particular expertise. **(True/False)**

   Answer: True.

   Explanation: For example, an agent can be created to know everything about a company's product catalog so it can draft detailed responses to customer questions or automatically compile product details.

4. Agents can enhance productivity in which of the following main areas? **(Select all that apply)**

   a. Information retrieval
   b. Performing actions
   c. Operate independently

   Answer: a, b, c.

   Explanation: Agents can retrieve information, perform actions on behalf of users, and operate independently to handle routine or multistep tasks.

5. Which of the following are types of agents supported by Microsoft 365 Copilot? **(Select all that apply)**

   a. Prebuilt agents
   b. Ready-made SharePoint site agents
   c. Agents for the everyday business user
   d. Advanced agents

   Answer: a, b, c, d.

   Explanation: These four categories cover agents from Microsoft-created, site-specific, user-created simple agents, to developer-built sophisticated agents.

6. A prebuilt agent is an agent that either Microsoft or a Microsoft-approved vendor created. **(True/False)**

   Answer: True.

   Explanation: Non-Microsoft agents undergo a rigorous approval process to ensure they meet industry standards and best practices.

7. Prompt Coach and Writing Coach are examples of prebuilt agents. **(True/False)**

   Answer: True.

   Explanation: Prompt Coach helps users craft effective prompts, while Writing Coach provides detailed feedback on writing tasks.

8. A ready-made agent for a SharePoint site is automatically created when certain conditions are met, including a valid Copilot license and proper permissions. **(True/False)**

   Answer: True.

   Explanation: This agent is scoped to the content within the site and can answer questions about documents and provide insights based on the site's information.

9. Agents for the everyday business user are designed with limited capabilities to prioritize simplicity, ease of use, and security. **(True/False)**

   Answer: True.

   Explanation: They do not use advanced features like generative AI and can be created without any programming background.

10. Advanced agents require programming skills and are intended for developers who need highly customized solutions. **(True/False)**

    Answer: True.

    Explanation: They support features like custom connectors and generative AI and are built using tools like Copilot Studio or Visual Studio Code.

11. In Microsoft 365 Copilot Chat, users can use prebuilt agents from their personal agent library and create new agents with Copilot Studio. **(True/False)**

    Answer: True.

    Explanation: Agents in Copilot Chat provide real-time support, automate responses, and predict user needs based on context.

12. Agents in SharePoint can be ready-made (site-specific) or custom agents created by users with Edit permissions or higher. **(True/False)**

    Answer: True.

    Explanation: These agents help with workflows, projects, content discovery, and knowledge sharing based on the site's content.

13. When creating an agent, knowledge sources can include which of the following? **(Select all that apply)**

    a. Web content

    b. SharePoint content

    c. Copilot connectors

    Answer: a, b, c.

    Explanation: These sources allow agents to combine public information with secure internal data and external business applications while respecting security boundaries.

14. Match each agent type with its key characteristic.

Agent Type	**Key Characteristic**
Prebuilt agents	Created by Microsoft or approved vendors, ready to use
Ready-made SharePoint site agents	Automatically created for new SharePoint sites, scoped to site content
Agents for everyday business users	No programming required, limited capabilities, template or custom options
Advanced agents	Require programming skills, support custom connectors and generative AI

Answer: Prebuilt agents → Created by Microsoft or approved vendors, ready to use; Ready-made SharePoint site agents → Automatically created for new SharePoint sites, scoped to site content; Agents for everyday business users → No programming required, limited capabilities, template or custom options; Advanced agents → Require programming skills, support custom connectors and generative AI.

Explanation: Each type serves different user needs and technical skill levels within Microsoft 365 Copilot.

15. Scenario: A sales manager wants an agent that knows the entire product catalog to draft customer responses. Which type of agent would best suit this need?

    a. An advanced agent built with Copilot Studio

    b. A ready-made SharePoint site agent

    c. A prebuilt agent only

    d. An everyday business user agent with basic options

    Answer: a. An advanced agent built with Copilot Studio.

    Explanation: Advanced agents support custom expertise, generative AI, and integration with detailed knowledge sources like product catalogs.

4.3

Compare Microsoft 365 Copilot and agents

Abbreviation	Full Form
AI	Artificial Intelligence
SIEM	Security Information and Event Management

1. Microsoft 365 Copilot and agents are two powerful AI-driven tools designed to enhance productivity and automate tasks. **(True/False)**

   Answer: True.

   Explanation: While they share common goals, they differ significantly in how they operate, the scope of their capabilities, and how users interact with them.

2. Microsoft 365 Copilot is a generative AI assistant embedded across Microsoft 365 apps like Word, Excel, Outlook, and Teams. **(True/False)**

   Answer: True.

   Explanation: It helps users by generating content, summarizing information, drafting communications, and analyzing data based on natural language prompts.

3. Agents are intelligent software entities that can be customized to perform specific tasks or workflows. **(True/False)**

   Answer: True.

   Explanation: They can be prebuilt, created by developers, or built by everyday business users and can act autonomously on behalf of users.

4. Copilot is reactive and assistive while agents can run automatically on a schedule or when specific events occur. **(True/False)**

   Answer: True.

   Explanation: Copilot responds to user input in real time, whereas agents work behind the scenes to complete tasks without constant user input.

5. How users interact with Copilot is primarily through direct, real-time interaction inside Microsoft 365 apps. **(True/False)**

   Answer: True.

   Explanation: Users type questions or requests and receive instant responses within the context of the app they are using.

6. Agents are built to run automatically and do not require constant user input. **(True/False)**

   Answer: True.

   Explanation: They can complete multi-step processes and include dashboards or logs for tracking.

7. Copilot only uses data that the individual user has permission to access. **(True/False)**

   Answer: True.

   Explanation: It works within the user's Microsoft 365 account and respects all existing security settings.

8. Agents often use service accounts or managed identities that define broader access across teams or systems. **(True/False)**

   Answer: True.

   Explanation: This allows them to work on behalf of a department or organization but requires careful permission management.

9. Customization of Copilot is mainly done at the organization level through configuration and tuning. **(True/False)**

   Answer: True.

   Explanation: Admins can adjust behavior, data usage, and features, but it does not involve building entirely new features.

10. Agents follow a lifecycle similar to software development, including design, testing, deployment, and updates. **(True/False)**

    Answer: True.

    Explanation: They can be version-controlled, rolled back, and monitored like code.

11. Copilot is ideal for short-cycle, user-driven tasks such as drafting content, summarizing meetings, and analyzing documents. **(True/False)**

    Answer: True.

    Explanation: It supports productivity by reducing manual effort while keeping the user in control of the final decision.

12. Agents excel at repeatable or multi-step processes that benefit from automation. **(True/False)**

    Answer: True.

    Explanation: They can be triggered by events or schedules and connect across applications for structured workflows.

13. Match each tool with its primary strength.

Tool	**Primary Strength**
Microsoft 365 Copilot	Embedded assistance for real-time content generation and analysis
Agents	Automation of repeatable multi-step processes and workflows

    Answer: Microsoft 365 Copilot → Embedded assistance for real-time content generation and analysis; Agents → Automation of repeatable multi-step processes and workflows.

    Explanation: Copilot boosts individual productivity within apps, while agents drive organizational efficiency through background automation.

14. Scenario: A user needs help drafting an email based on a recent meeting. Which tool is most appropriate?

    a. Microsoft 365 Copilot
    b. An agent
    c. Both equally
    d. Neither

    Answer: a. Microsoft 365 Copilot.

    Explanation: Copilot works directly in Outlook or Teams, using the context of the meeting to generate or summarize content in real time.

15. Scenario: An organization wants to automate nightly invoice processing that involves multiple systems and approvals. Which tool is more suitable?

    a. An agent
    b. Microsoft 365 Copilot
    c. Only manual processes
    d. Compliance Manager

    Answer: a. An agent.

    Explanation: Agents are designed for repeatable, multi-step processes that integrate with enterprise systems and can run on schedules.

16. Best practices for managing agents include using managed identities with least privilege, testing in non-production environments, and monitoring activity with alerts. **(True/False)**

    Answer: True.

    Explanation: These practices help ensure agents run securely, reliably, and in line with company policies while reducing risk.

4.4

Compare Microsoft 365 Copilot licensing models

Abbreviation	Full Form
DLP	Data Loss Prevention

1. Microsoft 365 Copilot is offered through a combination of plans and licensing models. **(True/False)**

   Answer: True.

   Explanation: The Copilot plan determines what features users get, while the licensing model determines how organizations pay for those features.

2. Copilot plans fall into three main categories. What are they?

   Answer: The free Copilot chat experience, the Microsoft 365 Copilot paid plan, and Copilot Studio.

   Explanation: The free plan offers basic conversational AI without organizational data access. The paid plan integrates Copilot across apps with Microsoft Graph grounding. Copilot Studio allows creation and management of custom agents.

3. The free Copilot chat experience allows basic conversational AI but does not access your organization's data in Microsoft 365. **(True/False)**

   Answer: True.

   Explanation: It provides web-grounded responses only and does not include work-grounded Copilot capabilities.

4. The Microsoft 365 Copilot paid plan integrates Copilot across Word, Excel, PowerPoint, Outlook, and Teams while grounding responses in Microsoft Graph data. **(True/False)**

   Answer: True.

   Explanation: It provides core security and compliance features and is available as an add-on for qualifying Business and Enterprise plans.

5. Copilot Studio allows everyday business users and developers to create, customize, and manage Copilot agents. **(True/False)**

   Answer: True.

   Explanation: Agent usage is governed by Copilot Credits through capacity packs or pay-as-you-go, depending on extent of use.

6. The two main licensing models for Microsoft 365 Copilot are monthly per-user license and pay-as-you-go consumption option. **(True/False)**

   Answer: True.

   Explanation: The monthly model provides predictable costs, while pay-as-you-go aligns costs with actual usage.

7. Under the monthly license model, organizations pay a fixed monthly fee per licensed user. **(True/False)**

   Answer: True.

   Explanation: This approach simplifies financial planning and license assignment through the Microsoft 365 admin center or PowerShell.

8. The pay-as-you-go model charges organizations based on actual usage through Azure consumption. **(True/False)**

   Answer: True.

   Explanation: Every prompt or interaction is metered and billed against Azure subscription resources.

9. Business plans support up to 300 users and are designed for small to mid-sized organizations. **(True/False)**

   Answer: True.

   Explanation: Users with Business Standard or Business Premium plans are eligible for the Microsoft 365 Copilot add-on license.

10. Enterprise plans scale to thousands of users and include advanced compliance tools such as Data Loss Prevention and Purview. **(True/False)**

    Answer: True.

    Explanation: They provide richer enterprise-grade tools for governance and security compared to Business plans.

11. SharePoint licensing decisions impact both cost and governance because SharePoint is a main data source powering Copilot. **(True/False)**

    Answer: True.

    Explanation: Copilot respects SharePoint permissions, but broader licensing can increase queries against sensitive libraries if access controls are not enforced.

12. In the pay-as-you-go model, heavy querying of large SharePoint libraries by project teams can generate sudden cost surges. **(True/False)**

    Answer: True.

    Explanation: Admins must plan for these scenarios with budget alerts and workload tagging.

13. Pilot testing with pay-as-you-go helps organizations collect real usage data before committing to monthly licensing. **(True/False)**

    Answer: True.

    Explanation: It provides evidence to decide whether a monthly or hybrid model is the best long-term choice.

14. Regular license audits are essential in the monthly model to remove licenses from inactive users. **(True/False)**

    Answer: True.

    Explanation: This prevents unnecessary spending on users such as interns or contractors who rarely use Copilot.

15. Scenario: A small consulting firm with 20 users wants Copilot grounded in their own project files. Which plan is required?

    a. Microsoft 365 Copilot paid plan
    b. Free Copilot chat experience only
    c. Personal/Family plan
    d. No license needed

    Answer: a. Microsoft 365 Copilot paid plan.

    Explanation: The free plan does not connect to organizational Microsoft Graph data, so paid licensing is required for work-grounded capabilities.

16. Scenario: An organization with fluctuating seasonal demand prefers to pay only for actual Copilot usage. Which licensing model best fits this need?

    a. Pay-as-you-go consumption option
    b. Monthly per-user license only
    c. Free plan exclusively
    d. Enterprise plan without add-ons

    Answer: a. Pay-as-you-go consumption option.

    Explanation: This model aligns costs with actual usage and is suitable for organizations with variable or pilot-level demand.

4.5

Explore real-world use cases for Copilot and agents

Abbreviation	Full Form
AI	Artificial Intelligence

1. Microsoft 365 Copilot integrates directly into apps like Word, Excel, Outlook, PowerPoint, and Teams. **(True/False)**

   Answer: True.

   Explanation: It accelerates common tasks such as drafting, summarizing, analyzing, and formatting content within the apps users already work in.

2. Copilot Chat provides a conversational interface to organizational data through Microsoft Graph across multiple applications. **(True/False)**

   Answer: True.

   Explanation: It lets users ask broader, cross-application questions and get answers that span emails, files, chats, and more.

3. The Researcher agent specializes in helping users work with unstructured information such as emails, Teams chats, Word documents, and SharePoint files. **(True/False)**

   Answer: True.

   Explanation: It applies semantic search, summarization, and context-aware filtering to pull the most relevant content.

4. The Analyst agent focuses on structured information such as tables, spreadsheets, and dashboards. **(True/False)**

   Answer: True.

   Explanation: It turns raw numbers into visualizations, statistical insights, and recommendations using natural language queries.

5. Writing Coach is a prebuilt agent that helps users improve written communication. **(True/False)**

   Answer: True.

   Explanation: It provides detailed, constructive feedback on emails, documents, stories, or whitepapers.

6. Career Coach assists users with professional development tasks such as resume feedback and interview preparation. **(True/False)**

   Answer: True.

   Explanation: It suggests relevant learning courses and helps draft cover letters or prepare for interviews.

7. Everyday business users can create simple agents in Copilot Studio or SharePoint for department-specific QnA or guided processes. **(True/False)**

   Answer: True.

   Explanation: These agents reduce repetitive questions and provide quick lookups without requiring programming skills.

8. SharePoint agents help with content discovery, document lifecycle assistance, and workflow enablement within SharePoint sites. **(True/False)**

   Answer: True.

   Explanation: They surface relevant documents, guide users through processes, and support site-specific knowledge sharing.

9. Custom advanced agents are suitable for complex, multi-system workflows such as vendor onboarding or supply chain monitoring. **(True/False)**

   Answer: True.

   Explanation: They integrate with APIs, automate multi-step processes, and reflect organization-specific logic.

10. Match each tool with its best use case.

Tool	Best Use Case
Microsoft 365 Copilot	Drafting emails, summarizing meetings, or analyzing data inside familiar apps
Researcher agent	Knowledge discovery and summarization of unstructured content
Analyst agent	Data analysis and visualization in Excel or Power BI
SharePoint agents	Content discovery and governance within SharePoint sites
Custom advanced agents	Complex, multi-system automation workflows

   Answer: Microsoft 365 Copilot → Drafting emails, summarizing meetings, or analyzing data inside familiar apps; Researcher agent → Knowledge discovery and summarization of unstructured content; Analyst agent → Data analysis and visualization in Excel or Power BI; SharePoint agents → Content discovery and governance within SharePoint sites; Custom advanced agents → Complex, multi-system automation workflows.

   Explanation: Each tool addresses different levels of interactivity, data type, and automation complexity.

11. Scenario: A project manager needs to quickly draft a status report based on yesterday's meeting notes in Word. Which tool is most appropriate?

    a. Microsoft 365 Copilot in Word
    b. A custom advanced agent
    c. The Researcher agent only
    d. SharePoint agent

    Answer: a. Microsoft 365 Copilot in Word.

    Explanation: Copilot works directly in the app context and uses the current document and recent meeting notes for drafting.

12. Scenario: A compliance officer must review hundreds of contracts for a specific clause. Which agent would best help condense and summarize them?

    a. Researcher agent
    b. Analyst agent
    c. Writing Coach
    d. SharePoint agent only

    Answer: a. Researcher agent.

    Explanation: The Researcher agent excels at summarization of long-form unstructured content and links back to original sources.

13. Scenario: A finance team wants to automate nightly aggregation of meeting transcripts into a prioritized backlog of action items. Which solution fits best?

    a. A custom agent
    b. Microsoft 365 Copilot in Teams only
    c. Analyst agent
    d. Writing Coach

    Answer: a. A custom agent.

    Explanation: Agents are ideal for repeatable, multi-step processes that run on schedules and create structured outputs like Planner tasks.

5

Perform basic administrative tasks for Microsoft 365 Copilot

5.1

Manage Copilot licenses and pay-as-you-go billing

Abbreviation	Full Form
IT	Information Technology

1. Assigning Microsoft 365 Copilot licenses is required for users to access Copilot features in Outlook, Word, Excel, or Teams. **(True/False)**

   Answer: True.

   Explanation: Without a license, Copilot does not appear for a user in these applications.

2. Individual license assignment is best suited for small organizations or when only a handful of users need access. **(True/False)**

   Answer: True.

   Explanation: It provides direct control and is useful for testing with a small pilot group or granting immediate access to specific users such as executives.

3. Group-based licensing is the recommended approach for medium-to-large organizations. **(True/False)**

   Answer: True.

   Explanation: It greatly reduces administrative overhead by automatically granting licenses to all members of a security group in Microsoft Entra ID.

4. When a new user is added to a group that has a Copilot license assigned, they automatically receive the license. **(True/False)**

   Answer: True.

   Explanation: This ensures consistency and eliminates the need to assign licenses manually for each new hire.

5. You should perform the following steps to assign a Copilot license to an individual user. Put them in the correct order.

   Answer: Sign in to the Microsoft 365 admin center → Users > Active users → Select the user → Licenses and apps → Select Microsoft 365 Copilot → Save changes.

   Explanation: This targeted method allows precise control over license assignment for testing or specific requests.

6. To assign group-based Copilot licensing, you first select or create a group in the Microsoft 365 admin center, then assign the license to that group. **(True/False)**

   Answer: True.

   Explanation: Any new member added to the group automatically inherits the Copilot license.

7. Pay-as-you-go billing allows organizations to use Copilot on-demand without committing to a fixed number of licenses. **(True/False)**

   Answer: True.

   Explanation: This model is particularly useful for departments experimenting with Copilot or for seasonal/project-based workforces.

8. Creating a billing policy is the first step in enabling pay-as-you-go for Copilot. **(True/False)**

   Answer: True.

   Explanation: The billing policy links an Azure subscription and defines which users it covers.

9. A single tenant can have up to 10 billing policies. **(True/False)**

   Answer: True.

   Explanation: This allows different departments or groups to have separate pay-as-you-go arrangements.

10. After creating a billing policy, you must connect it to a specific Copilot service on the Pay-as-you-go services tab. **(True/False)**

    Answer: True.

    Explanation: Connecting the policy to a service such as Copilot Chat or SharePoint agents enables usage-based billing for the defined users.

11. If a billing policy is created but not connected to any Copilot service, pay-as-you-go remains disabled for those users. **(True/False)**

    Answer: True.

    Explanation: Both steps are required to fully enable consumption-based billing.

12. Budget alerts can be configured when creating a billing policy to notify recipients when spending reaches certain thresholds. **(True/False)**

    Answer: True.

    Explanation: This helps prevent unexpected cost spikes by setting limits such as 80

13. Scenario: An organization wants to test Copilot with the Legal department before committing to full licenses. Which licensing approach is most appropriate?

    a. Create a billing policy for the Legal security group and enable pay-as-you-go for Copilot Chat
    b. Assign monthly licenses to all Legal users immediately
    c. Use only the free Copilot chat experience
    d. Disable Copilot entirely for Legal

    Answer: a. Create a billing policy for the Legal security group and enable pay-as-you-go for Copilot Chat.

    Explanation: Pay-as-you-go allows controlled experimentation without fixed monthly costs for the entire department.

14. Scenario: You need to assign Copilot licenses to 450 Sales employees efficiently. Which method should you use?

    a. Group-based licensing using a Sales Users group in Microsoft Entra ID
    b. Individual assignment to each user
    c. Free Copilot chat only
    d. Pay-as-you-go without any policy

    Answer: a. Group-based licensing using a Sales Users group in Microsoft Entra ID.

    Explanation: Group-based licensing reduces administrative effort and ensures consistent access for large groups.

15. Regular license audits are essential in the monthly licensing model to remove licenses from inactive users. **(True/False)**

    Answer: True.

    Explanation: This prevents unnecessary spending on users who no longer need Copilot access.

5.2

Monitor and adjust pay-as-you-go Copilot usage

Abbreviation	Full Form
IT	Information Technology

1. Usage monitoring and adjustment is the ongoing process of checking whether the pay-as-you-go model remains the right fit for the organization. **(True/False)**

   Answer: True.

   Explanation: Unlike standard licenses with predictable monthly costs, pay-as-you-go charges fluctuate based on actual use, making regular monitoring essential.

2. Monitoring Copilot usage provides real-world data about adoption patterns and helps decide whether to switch high-use groups to permanent licenses. **(True/False)**

   Answer: True.

   Explanation: For example, consistent heavy usage by the Operations team may make full-time licenses more cost-effective than accumulating per-use charges.

3. Billing dashboards are available in both the Microsoft 365 admin center and the Azure portal. **(True/False)**

   Answer: True.

   Explanation: The Microsoft 365 admin center offers a high-level overview of licenses and invoices, while Azure Cost Management provides detailed analytics, budgets, and forecasting.

4. In the Microsoft 365 admin center, you can view Copilot invoices under Billing > Bills and payments and check active licenses under Billing > Licenses. **(True/False)**

   Answer: True.

   Explanation: These dashboards help confirm license allocation and review month-over-month trends.

5. In the Azure portal, Cost analysis allows you to filter specifically for Microsoft 365 Copilot (PAYG) usage. **(True/False)**

   Answer: True.

   Explanation: You can group costs by resource, user, or department tags and export data for deeper analysis in Excel or Power BI.

6. Setting up budgets and alerts in Azure Cost Management notifies administrators when spending reaches defined thresholds. **(True/False)**

   Answer: True.

   Explanation: For example, an alert at 80

7. Scenario: A department shows consistent daily Copilot usage every week. What action should be considered?

   a. Switch the department to permanent monthly licenses
   b. Leave them on pay-as-you-go indefinitely
   c. Disable Copilot for that department
   d. Reduce their access through policies

   Answer: a. Switch the department to permanent monthly licenses.

   Explanation: Steady, predictable usage patterns indicate that fixed licensing would be more cost-effective than ongoing pay-as-you-go charges.

8. Scenario: An unexpected daily cost spike appears in Cost analysis for a pilot group. What is the recommended first step?

   a. Investigate the cause, such as accidental unrestricted access
   b. Immediately cancel the pay-as-you-go policy
   c. Ignore it if under budget
   d. Assign permanent licenses to everyone

   Answer: a. Investigate the cause, such as accidental unrestricted access.

   Explanation: Early detection through monitoring allows quick remediation before costs balloon further.

9. Weekly checks in the Microsoft 365 admin center combined with monthly deep dives in Azure Cost Management provide balanced oversight of pay-as-you-go usage. **(True/False)**

   Answer: True.

   Explanation: This schedule helps catch both short-term anomalies and long-term trends for informed licensing decisions.

10. If a group shows heavy, consistent usage after a pilot period, administrators should consider moving them from pay-as-you-go to permanent licenses. **(True/False)**

    Answer: True.

    Explanation: This adjustment optimizes costs based on actual adoption data collected through monitoring.

5.3

Monitor Microsoft 365 Copilot usage and adoption

Abbreviation	Full Form
IT	Information Technology

1. Monitoring how people actually use Microsoft 365 Copilot is the operational backbone of any responsible rollout. **(True/False)**

   Answer: True.

   Explanation: Usage and adoption data turn licensing and feature decisions from guesswork into evidence-based actions.

2. Tracking adoption starts with two basic counters: who is enabled (has a Copilot license) and who is active (used Copilot within the reporting period). **(True/False)**

   Answer: True.

   Explanation: The rate between enabled and active users reveals whether a deployment is actually being used.

3. The Microsoft 365 admin center Reports > Usage section shows Enabled Users, Active Users, and trend charts for Microsoft 365 Copilot. **(True/False)**

   Answer: True.

   Explanation: These reports provide a quick operational view of adoption and can be exported for further analysis.

4. Group-based licensing and per-user last activity data help admins identify teams that need targeted training or license reallocation. **(True/False)**

   Answer: True.

   Explanation: Exporting user-level details allows joining with HR data to isolate specific teams and managers for follow-up.

5. Copilot Analytics, available through Viva Insights, surfaces feature-level and impact signals such as meeting summaries generated and email threads summarized. **(True/False)**

   Answer: True.

   Explanation: It helps measure business impact and supports targeted enablement campaigns.

6. The Copilot Dashboard in Viva Insights requires appropriate licensing and role assignments before it becomes visible. **(True/False)**

   Answer: True.

   Explanation: Minimum group size, exclusion lists, and privacy settings must be configured to protect personal information.

7. Trend analysis over weeks or months helps answer whether usage is growing, flattening, or declining. **(True/False)**

   Answer: True.

   Explanation: It connects adoption patterns to specific actions such as training sessions or product updates.

8. Adoption funnels track users moving from being licensed, to trying Copilot once, to becoming frequent users. **(True/False)**

   Answer: True.

   Explanation: This view reveals where drop-offs occur and where additional support may be needed.

9. Feature diffusion refers to the uneven spread of specific Copilot capabilities across the organization. **(True/False)**

   Answer: True.

   Explanation: Spotting gaps, such as low use of meeting summarization in Teams, allows targeted communications or training.

10. Seasonality in Copilot usage often aligns with business cycles, such as quarterly reporting in Finance or annual reviews in HR. **(True/False)**

    Answer: True.

    Explanation: Recognizing these patterns helps plan adoption support around peak demand periods.

11. Microsoft 365 admin center reports are best for quick operational checks, while Viva Insights and Power BI templates support deeper impact analysis. **(True/False)**

    Answer: True.

    Explanation: Combining these tools gives both summary views and detailed, leadership-ready dashboards.

12. Scenario: Marketing has 150 enabled users but only 22 active users in the last 30 days. What is the recommended next step?

    a. Export user data, identify teams, and run targeted training
    b. Immediately remove all licenses
    c. Ignore the data if under budget
    d. Disable Copilot for Marketing

    Answer: a. Export user data, identify teams, and run targeted training.

    Explanation: Low active rates often indicate communication or applicability gaps that can be addressed with focused enablement.

13. Scenario: A sudden spike in Copilot usage appears from a single account. What should be investigated?

    a. Whether it is an automated process or misconfigured account
    b. Immediate license removal for the entire organization
    c. Disabling all Copilot features
    d. Nothing, as spikes are always positive

    Answer: a. Whether it is an automated process or misconfigured account.

    Explanation: Outliers in usage patterns can indicate automation errors or policy violations that require follow-up.

5.4

Manage and govern Microsoft 365 Copilot prompts

Abbreviation	Full Form
IT	Information Technology
KPI	Key Performance Indicator

1. Prompts in Microsoft 365 Copilot can be saved and reused to streamline everyday tasks. **(True/False)**

   Answer: True.

   Explanation: A saved prompt captures a specific way of asking Copilot to perform a task, helping users achieve consistent results.

2. Saving a prompt allows users to repeat the same workflow without retyping or recalling the full request. **(True/False)**

   Answer: True.

   Explanation: For example, a Finance team member might save a prompt in Excel that generates a month-end summary with consistent formatting and commentary.

3. Prompt management in Copilot currently happens at the individual level within Copilot-enabled apps. **(True/False)**

   Answer: True.

   Explanation: Users can create, edit, and organize their own saved prompts directly in the in-app Copilot panel.

4. Admins can configure tenant-wide Copilot settings such as feature availability, data access, and compliance controls in the Microsoft 365 admin center. **(True/False)**

   Answer: True.

   Explanation: While there is no centralized prompt repository, these settings govern how Copilot operates across Microsoft 365 apps.

5. To save a prompt in an app such as Word, a user selects the Save Prompt option at the bottom of the Copilot panel after typing a custom instruction. **(True/False)**

   Answer: True.

   Explanation: Users are then prompted to provide a name and description for the saved prompt.

6. A clear naming convention such as prefixing prompts with the department or purpose makes them easy to identify later. **(True/False)**

   Answer: True.

   Explanation: For example, using names like "Finance – Monthly Summary Report" helps when scaling to dozens or hundreds of prompts.

7. Saved prompts can be shared with a team or group through Microsoft 365 Groups. **(True/False)**

   Answer: True.

   Explanation: Sharing ensures all members have access to a standard workflow, such as an HR prompt for drafting onboarding checklists.

8. Scheduling prompts allows them to run at predefined times, which is useful for recurring tasks such as generating weekly KPI dashboards. **(True/False)**

   Answer: True.

   Explanation: Users define frequency and timing in the Copilot Scheduler within supported apps.

9. Old or redundant prompts should be deleted to prevent clutter and confusion. **(True/False)**

   Answer: True.

   Explanation: Reviewing prompts quarterly and archiving those no longer in active use maintains a clean prompt library.

10. Consistent naming conventions, detailed documentation, and prompt templates help achieve prompt standardization across teams. **(True/False)**

    Answer: True.

    Explanation: These practices reduce variation, ensure consistent outputs, and make governance easier.

11. Prompt governance includes restricting who can share prompts and regularly auditing prompt usage. **(True/False)**

    Answer: True.

    Explanation: Admins can restrict sharing to specific roles or groups and review usage reports to identify rarely used or high-usage prompts.

12. Prompts should reference secure data sources rather than embedding sensitive information directly. **(True/False)**

    Answer: True.

    Explanation: This approach ensures Microsoft 365 permissions enforce access and reduces the risk of data exposure.

13. Scenario: A Finance team wants to reuse the same prompt every month to generate a standardized report. What should they do?

    a. Save the prompt with a clear name and description
    b. Type the prompt manually each month
    c. Share it only with external partners
    d. Delete the prompt after one use

    Answer: a. Save the prompt with a clear name and description.

    Explanation: Saving the prompt allows consistent results and avoids retyping the full request each month.

14. Scenario: An organization notices multiple similar prompts being used across departments, causing inconsistent outputs. What best practice should be implemented?

    a. Establish consistent naming conventions and provide prompt templates
    b. Allow users to create prompts without any guidelines
    c. Disable prompt saving entirely
    d. Only use prebuilt Microsoft prompts

    Answer: a. Establish consistent naming conventions and provide prompt templates.

    Explanation: This reduces variation and ensures prompts align with organizational standards and policies.

5.5

Apply operational best practices for Microsoft 365 Copilot

Abbreviation	Full Form
RBAC	Role-Based Access Control
IT	Information Technology

1. Running Microsoft 365 Copilot successfully requires well-defined processes for administrative roles, licensing, onboarding, troubleshooting, and communication. **(True/False)**

   Answer: True.

   Explanation: Without these processes, organizations risk security, compliance, or efficiency gaps that slow adoption and frustrate users.

2. Organizations should avoid relying solely on the Global Administrator role and instead adopt the principle of least privilege. **(True/False)**

   Answer: True.

   Explanation: Scoped roles prevent accidental damage and reduce risk while empowering admins to perform their specific responsibilities.

3. The License Administrator role allows assignment and removal of licenses without granting access to security, compliance, or directory-wide settings. **(True/False)**

   Answer: True.

   Explanation: This role is appropriate for department leads who need to manage Copilot licenses for their teams.

4. Group-based licensing in Microsoft Entra ID automatically applies a Copilot license to all members of a security group. **(True/False)**

   Answer: True.

   Explanation: This approach reduces administrative overhead and ensures consistency when onboarding new users.

5. When onboarding new users, integrating license assignment into the standard account creation process ensures no one is overlooked. **(True/False)**

   Answer: True.

   Explanation: Adding new hires to a department-specific security group that has a Copilot license assigned automatically grants them access.

6. Copilot does not appear in Office apps when the user lacks the correct license or the license has not yet propagated. **(True/False)**

   Answer: True.

   Explanation: This is one of the most common issues and can also occur due to outdated versions of Microsoft 365 Apps.

7. To confirm a user's Copilot license assignment, an admin should check the Licenses and apps section in the user's detail pane. **(True/False)**

   Answer: True.

   Explanation: This verification step helps identify whether a missing license is causing the issue.

8. Communication with end users about Copilot rollout should include announcements before rollout, onboarding emails, and ongoing updates. **(True/False)**

   Answer: True.

   Explanation: Clear communication reduces confusion, improves adoption, and prevents unnecessary support tickets.

9. Email announcements for Copilot should include screenshots showing where the Copilot button appears in apps. **(True/False)**

   Answer: True.

   Explanation: Visual guides help users recognize the new feature immediately and reduce predictable helpdesk queries.

10. Training sessions that demonstrate everyday use cases, such as drafting emails in Outlook or summarizing reports in Word, make Copilot feel approachable. **(True/False)**

    Answer: True.

    Explanation: Recording and publishing these sessions ensures broader reach for users who cannot attend live.

11. Scenario: A junior IT technician is responsible only for resetting user passwords. Which role should they be assigned?

    a. Helpdesk Administrator
    b. Global Administrator
    c. Billing Administrator
    d. Compliance Administrator

    Answer: a. Helpdesk Administrator.

    Explanation: This role allows password resets while preventing access to sensitive billing data or tenant-wide changes.

12. Scenario: A department lead wants to manage Copilot licenses for their 75 team members. What is the most efficient method?

    a. Create a security group and assign the Copilot license to the group
    b. Assign licenses individually to each user
    c. Use the free Copilot chat experience only
    d. Disable license assignment entirely

    Answer: a. Create a security group and assign the Copilot license to the group.

    Explanation: Group-based licensing reduces manual effort and ensures consistent access for the entire team.

13. Scenario: Users report that Copilot is not visible in Word and Excel. What should the admin check first?

    a. Whether the users have the correct Copilot license assigned and the latest version of Microsoft 365 Apps
    b. Network firewall settings only
    c. SharePoint site permissions
    d. Teams admin center policies only

    Answer: a. Whether the users have the correct Copilot license assigned and the latest version of Microsoft 365 Apps.

    Explanation: Missing licenses or outdated app versions are the most common reasons Copilot does not appear.

6

Explore Microsoft 365 Copilot and agent administration

6.1

Create a Microsoft 365 Copilot Chat agent - Part 1

Abbreviation	Full Form
AI	Artificial Intelligence
UI	User Interface

1. To create an agent in Microsoft 365 Copilot Chat, you must select the Create agent option in the navigation pane on the Copilot Chat page. **(True/False)**

   Answer: True.

   Explanation: Doing so opens Copilot Studio, which you use to create agents.

2. Copilot Studio provides two experiences for creating agents. What are they?

   Answer: Copilot Studio "lite" experience and Copilot Studio "full" experience.

   Explanation: The lite experience is designed for business users with no programming background, while the full experience is intended for software developers who require advanced customization.

3. The lite experience in Copilot Studio is designed for business users with no programming background. **(True/False)**

   Answer: True.

   Explanation: It provides a simple interface that makes creating agents easy using either step-by-step options or plain language descriptions.

4. In the lite experience, you can author an agent in two ways. What are they?

   Answer: Through the Describe tab and through the Configure tab.

   Explanation: The Describe tab uses plain language to describe what you want the agent to do, while the Configure tab allows you to manually build the agent step-by-step.

5. When using the Describe tab, you can optionally base your agent on a predefined agent template. **(True/False)**

   Answer: True.

   Explanation: Templates provide a starting point with preconfigured settings, description, and instructions that can be customized.

6. Templates in Copilot Studio offer advantages such as ease of creation, consistency, best practices, customization, and efficiency. **(True/False)**

   Answer: True.

   Explanation: They streamline the agent creation process and ensure quality while allowing flexibility for customization.

7. Within the Describe tab, you provide the agent's name, description, and instructions using natural language. **(True/False)**

   Answer: True.

   Explanation: Copilot Studio interprets your instructions and creates a draft version of the agent.

8. After entering your description, Copilot Studio creates several starter prompts for the agent. **(True/False)**

   Answer: True.

   Explanation: You can later edit or remove these starter prompts or add new ones in the Configure tab.

9. The instructions guide the agent on how to behave and respond to users. **(True/False)**

   Answer: True.

   Explanation: If you selected a template, predefined instructions are inserted and can be customized.

10. Once you finalize the agent's instructions on the Describe tab, you can optionally test the draft version of the agent. **(True/False)**

    Answer: True.

    Explanation: Even without defining specific knowledge sources, the agent can provide responses based on its built-in capabilities and general knowledge.

11. The availability of the Describe tab depends on geographic availability and language support. **(True/False)**

    Answer: True.

    Explanation: If the Describe tab is not supported, you can manually build the agent through the Configure tab.

12. Scenario: A business user with no programming experience wants to create an agent that answers common questions about company vacation policies. Which approach should they use?

    a. Use the Describe tab with plain language instructions
    b. Use only the full Copilot Studio experience
    c. Write custom code in Visual Studio Code
    d. Request a developer to build it

    Answer: a. Use the Describe tab with plain language instructions.

    Explanation: The lite experience allows nontechnical users to create agents by describing what they want in plain language.

13. Scenario: You want to create an agent based on a template for handling employee onboarding questions. What benefit does selecting a template provide?

    a. It provides a starting point with preconfigured settings that can be customized
    b. It automatically deploys the agent to all users
    c. It removes the need for any further configuration
    d. It bypasses all security and compliance checks

    Answer: a. It provides a starting point with preconfigured settings that can be customized.

    Explanation: Templates ensure consistency and best practices while still allowing customization to meet specific needs.

6.2

Create a Microsoft 365 Copilot Chat agent - Part 2

Abbreviation	Full Form
MB	Megabyte

1. If you used the Describe tab in Copilot Studio to create the initial draft version of your agent, you can then switch over to the Configure tab to customize and edit the remaining details of the agent. **(True/False)**

   Answer: True.

   Explanation: You can switch over to the Configure tab to customize and edit the remaining details of the agent if you used the Describe tab for the initial draft.

2. If the Describe tab isn't available in your region or preferred language, then you must create the entire agent using the Configure tab. **(True/False)**

   Answer: True.

   Explanation: You must create the entire agent using the Configure tab if you choose not to use the Describe tab or if it isn't available in your region or preferred language.

3. The Describe tab and the Configure tab are synchronized. **(True/False)**

   Answer: True.

   Explanation: Any changes made in the Describe tab are reflected in the Configure tab, and vice-versa, allowing you to switch between the two tabs for a seamless authoring experience.

4. The Configure tab enables you to view and edit detailed information about the agent, giving you more control and precision over its performance. **(True/False)**

   Answer: True.

   Explanation: The Configure tab enables you to view and edit detailed information about the agent, giving you more control and precision over its performance.

5. When you open the Configure tab, you can optionally select a template that provides the foundation for your agent. **(True/False)**

   Answer: True.

   Explanation: You can optionally select a template that provides the foundation for your agent when you open the Configure tab.

6. If you're using the Configure tab because you didn't have access to the Describe tab due to your region or preferred language, the template provides a starting point with preconfigured settings and structures. **(True/False)**

   Answer: True.

   Explanation: The template provides a starting point with preconfigured settings and structures in such cases.

7. If you select a template on the Describe tab, you can override your choice by selecting a different template on the Configure tab. **(True/False)**

   Answer: True.

   Explanation: You can override your choice by selecting a different template on the Configure tab.

8. When you switch templates on the Configure tab after making customizations in the Describe tab, what happens?

   Answer: Copilot Studio resets the agent's configuration to match the settings and structure of the new template.

   Explanation: Any specific changes or customizations you made in the Describe tab are replaced by the new template's predefined settings.

9. You should carefully consider whether you want to switch templates after making customizations. **(True/False)**

   Answer: True.

   Explanation: Switching templates resets the agent's configuration to the new template's defaults.

10. Every agent is assigned the system's default icon for agents. **(True/False)**

    Answer: True.

    Explanation: Every agent is assigned the system's default icon for agents, as seen in the Details section.

11. You can change the default icon to a customized icon by selecting the Edit (pencil) icon. **(True/False)**

    Answer: True.

    Explanation: Selecting the Edit (pencil) icon allows you to change the default icon.

12. What are the requirements for an agent's icon?

    Answer: It must be a .png file, and it can't exceed 1 MB in size.

    Explanation: An agent's icon must be a .png file, and it can't exceed 1 MB in size.

13. At this point, you can enter or edit the agent's name, description, and instructions. **(True/False)**

    Answer: True.

    Explanation: You can enter or edit the agent's name, description, and instructions on the Configure tab.

14. If you entered instructions on the Describe tab along with any follow-up responses to questions posed by Copilot Studio, how do the instructions appear on the Configure tab?

    Answer: The instructions that appear on the Configure tab are the builder's interpretation of that conversation. Each task or instruction that you provided are listed in a bulleted fashion.

    Explanation: The instructions appear as the builder's interpretation listed in bulleted fashion.

15. If you don't have access to the Describe tab, or you chose to skip the Describe tab and go straight to the Configure tab, you can still enter your instructions in the Configure tab using natural language. **(True/False)**

    Answer: True.

    Explanation: You can enter your instructions using natural language on the Configure tab.

16. When you enter natural language instructions on the Configure tab, what does Copilot Studio do?

    Answer: Copilot Studio interprets your natural language instructions and replaces them with the interpreted instructions.

    Explanation: This enables you to verify the agent's behavior is accurately defined based on your input.

17. Unlike the Describe tab, the Configure tab doesn't ask you questions to clarify your instructions. **(True/False)**

    Answer: True.

    Explanation: The Configure tab does not include the interactive, question-based refinement process found in the Describe tab.

18. You should review the instructions to ensure Copilot Studio correctly interpreted the instructions that you provided. **(True/False)**

    Answer: True.

    Explanation: Edit any bullet points that you feel need refinement after reviewing the instructions.

19. If you select a template on the Configure tab, the system inserts predefined instructions related to the selected template. **(True/False)**

    Answer: True.

    Explanation: You can customize these instructions if you wish, or replace them with your own customized instructions.

20. After you verify or update the agent's name, description, and instructions, you're then ready to customize the remaining details of your agent by updating the knowledge sources. **(True/False)**

    Answer: True.

    Explanation: Updating the knowledge sources begins with selecting various data sources to enhance the agent.

21. In the Knowledge section, you can select folders and file types such as .docx, .doc, .pptx, .ppt, and .html. **(True/False)**

    Answer: True.

    Explanation: You can select folders and file types or add a SharePoint site.

22. In the Knowledge section, you can enable or disable the agent from accessing the Web. **(True/False)**

    Answer: True.

    Explanation: Web content access can be enabled or disabled depending on your organization's settings.

23. You can enter a URL for a SharePoint site or folder, such as contoso.sharepoint.com/sites/policies. **(True/False)**

    Answer: True.

    Explanation: SharePoint sites or folders can be added using their URL.

24. You can select Microsoft Copilot connectors (formerly Graph connectors). **(True/False)**

    Answer: True.

    Explanation: These connectors allow agents to include knowledge from external repositories or systems such as customer accounts, incident tickets, and knowledge articles.

25. What is the maximum number of knowledge sources you can add per agent?

    Answer: 20

    Explanation: You can add up to 20 knowledge sources per agent. These sources can be sites, document libraries, folders, or files.

26. The ability to enable or disable web content access depends on your organization's settings. **(True/False)**

    Answer: True.

    Explanation: If an IT admin disables the "Allow web search in Copilot" policy, the web content toggle becomes unavailable to users.

27. If Restricted SharePoint Search is enabled, you can't use SharePoint as a knowledge source. **(True/False)**

    Answer: True.

    Explanation: Restricted SharePoint Search prevents using SharePoint as a knowledge source.

28. With a Microsoft 365 Copilot license, what is the maximum file size supported?

    Answer: 200 MB

    Explanation: Files up to 200 MB are supported with a Microsoft 365 Copilot license. The maximum file size supported can vary based on your organization's licensing and configuration.

29. Newly uploaded files to SharePoint might take several minutes to be ready for the agent to include in its responses. **(True/False)**

    Answer: True.

    Explanation: You can check the file readiness by looking in the Knowledge section in the Configure tab; the file has the word "Preparing" next to it.

30. In the Capabilities section, you can optionally enable the Code interpreter and Image generator features. **(True/False)**

    Answer: True.

    Explanation: Both features are turned off by default.

31. The Code interpreter enables the agent to solve complex tasks using Python code. **(True/False)**

    Answer: True.

    Explanation: You enter a natural language prompt in the agent, and the Code interpreter interprets the meaning of your prompt and generates Python code behind the scenes.

32. The Image generator is based on Microsoft's existing Designer functionality and uses DALL-E technology. **(True/False)**

    Answer: True.

    Explanation: It creates visually appealing and contextually relevant graphics. The Image generator can produce multiple images for each prompt, and users can interact with these images by viewing them in full size, downloading, or modifying them with subsequent prompts.

33. In the Starter prompts section, you can add, remove, and edit starter prompts. **(True/False)**

    Answer: True.

    Explanation: Starter prompts are predefined suggestions or questions designed to help users initiate a task or conversation related to your agent.

34. If you select a template, the system inserts predefined starter prompts related to the selected template. **(True/False)**

    Answer: True.

    Explanation: If you didn't select a template, Copilot Studio automatically creates several suggested prompts based on the agent's description.

35. When you create an agent in Microsoft 365 Copilot Chat, you can assign an unlimited number of starter prompts to each agent. **(True/False)**

    Answer: True.

    Explanation: You can use the suggested prompts as is, or you can edit or remove them, or add your own custom prompts.

36. Once you finish configuring your agent in the Configure tab, you can test the draft version of the agent on the same page. **(True/False)**

    Answer: True.

    Explanation: Testing an agent helps ensure that it's well-designed, functional, and ready to meet the needs of your users.

37. When you select the Create button, what actions occur besides converting the draft version to a live version? **(Select all that apply)**

    a. Activation
    b. Deployment
    c. Configuration synchronization
    d. Availability
    e. Monitoring and analytics

    Answer: a, b, c, d, e.

    Explanation: The agent becomes active and ready for use, is deployed to the specified environment, configurations are synchronized, it becomes available for sharing and collaboration, and it is set up for monitoring and analytics.

38. When the agent is successfully created, the system returns a dialog box that allows you to either share the agent or open the agent. **(True/False)**

    Answer: True.

    Explanation: This window allows you to either share the agent by selecting the Change sharing settings option or open the agent to start using it by selecting the Go to agent button.

6.3

Create a SharePoint agent

Abbreviation	Full Form
MB	Megabyte

1. To create an agent in SharePoint, a user must have Edit permissions or higher for the SharePoint site or document library for which they plan to create the agent. **(True/False)**

   Answer: True.

   Explanation: A user must have Edit permissions or higher for the SharePoint site or document library to create an agent in SharePoint.

2. While you use Copilot Studio to create agents in Copilot Chat, you use the Copilot agent tool in SharePoint to create SharePoint agents. **(True/False)**

   Answer: True.

   Explanation: You use the Copilot agent tool in SharePoint to create SharePoint agents.

3. You can create your own SharePoint agent and edit a previously created agent by customizing its branding and purpose. **(True/False)**

   Answer: True.

   Explanation: You can customize its branding and purpose when creating or editing a SharePoint agent.

4. You can create your own SharePoint agent and edit a previously created agent by adding or removing the sites, pages, and files your agent should include as knowledge sources beyond the current SharePoint site. **(True/False)**

   Answer: True.

   Explanation: You can add or remove the sites, pages, and files your agent should include as knowledge sources beyond the current SharePoint site.

5. You can create your own SharePoint agent and edit a previously created agent by refining the agent's behavior by writing customized prompts tailored to the purpose and scope of the agent. **(True/False)**

   Answer: True.

   Explanation: You can refine the agent's behavior by writing customized prompts tailored to the purpose and scope of the agent.

6. The agent only answers your questions using information from sites, pages, and files that you already have access to and included as the agent's sources. **(True/False)**

   Answer: True.

   Explanation: The agent only answers your questions using information from sites, pages, and files that you already have access to and included as the agent's sources.

7. After you sign into your SharePoint site, there are four places from which you can initiate the process to create a new agent. **(True/False)**

   Answer: True.

   Explanation: The four places are the SharePoint site's homepage, the command bar of a document library, the context menu of the selected files in a document library, and the agent chat pane.

8. No matter where you choose to create your agent from, once you select the option to create a new agent, the agent is immediately ready and scoped to your selection. **(True/False)**

   Answer: True.

   Explanation: The agent is immediately ready and scoped to your selection regardless of the starting point.

9. On the site home page, you can select +New and then select Agent from the drop-down menu that appears to create a new agent. **(True/False)**

   Answer: True.

   Explanation: On the SharePoint site's homepage, select +New and then select Agent from the drop-down menu.

10. On a document library, you can choose Create an agent for all supported files in this library from the command bar. **(True/False)**

    Answer: True.

    Explanation: The command bar of a document library allows you to choose Create an agent for all supported files in this library.

11. You can select specific files in a document library and then select Create an agent from the context menu. **(True/False)**

    Answer: True.

    Explanation: Instead of creating an agent for all files, you can select the files you want and then select Create an agent from the context menu by either right-clicking or selecting the ellipsis.

12. On any site, page, or document library, you can select the Copilot button on the upper right corner of the window to open the agent, then select the drop-down next to the current agent and then select Create an agent. **(True/False)**

    Answer: True.

    Explanation: This is the method to create an agent from the agent chat pane.

13. Once you initiate the process of creating a SharePoint agent, the Copilot agent tool in SharePoint opens and creates a draft version of your agent. **(True/False)**

    Answer: True.

    Explanation: The Copilot agent tool opens and displays a draft version in the Create your new agent window.

14. The Create your new agent form contains three tabs. **(True/False)**

    Answer: True.

    Explanation: The three tabs are Overview, Sources, and Behavior. The Overview tab is opened first.

15. In the Overview tab, you must enter the agent's name and description. **(True/False)**

    Answer: True.

    Explanation: Default values are provided for each field, but you can change them if you wish.

16. In the Overview tab, you can select the Change option to customize the default icon associated with the agent. **(True/False)**

    Answer: True.

    Explanation: An agent icon must be a .png file that doesn't exceed 1 MB in size.

17. When you first access the Create your new agent form, you're configuring a draft version of the agent. **(True/False)**

    Answer: True.

    Explanation: All changes made on each of the tabs before selecting the Create button are made to the draft version of the agent.

18. Once you select the Create button, the agent is changed to a live version. **(True/False)**

    Answer: True.

    Explanation: After selecting the Create button, any changes you make are made to the live version of the agent.

19. After you configure the Overview tab, you should then select the Sources tab. **(True/False)**

    Answer: True.

    Explanation: The Sources tab enables you to define more sources to the draft version of your agent.

20. A SharePoint site agent allows you to add up to 20 sources for an individual agent. **(True/False)**

    Answer: True.

    Explanation: A SharePoint site agent is similar to an agent created in Copilot Chat in that you can add up to 20 sources for an individual agent.

21. The default source for a SharePoint agent is the entire SharePoint site. **(True/False)**

    Answer: True.

    Explanation: You can see this option in the source field, where the default value is Source from entire site.

22. If you select the Sourced from document libraries, folders, or files option, what menu option appears below it?

    Answer: +Add document libraries, folders, or files

    Explanation: Selecting this menu option opens the Pick items window.

23. In the Pick items window, you can select all the files and folders in the Documents library by choosing the Select button. **(True/False)**

    Answer: True.

    Explanation: Doing so returns you to the Sources tab and displays Documents below the Sourced from document libraries, folders, or files field.

24. In the Pick items window, you can select specific files and folders within the Documents library. **(True/False)**

    Answer: True.

    Explanation: A check mark appears next to the selected files and folders, and they are displayed below the Sourced from document libraries, folders, or files field on the Sources tab.

25. Once you finish defining your sources on the Sources tab, you should select the Behavior tab. **(True/False)**

    Answer: True.

    Explanation: The Behavior tab allows you to define a Welcome message, which is displayed when a user selects this agent in SharePoint.

26. The Welcome message field is available in SharePoint agents but not in Copilot Chat agents. **(True/False)**

    Answer: True.

    Explanation: This message field is available in SharePoint agents.

27. In SharePoint agents, you can configure up to three starter prompts. **(True/False)**

    Answer: True.

    Explanation: SharePoint agents are limited to three starter prompts, whereas Copilot Chat agents can have an unlimited number of starter prompts.

28. In the Behavior tab, you can define the instructions for the agent using natural language text. **(True/False)**

    Answer: True.

    Explanation: You can always refine the instructions manually, but the Copilot agent tool in SharePoint doesn't prompt you with any suggested changes or carry on a conversation regarding changes to the instructions.

29. The Copilot tool in SharePoint doesn't allow you to configure your agent based on a predefined agent template. **(True/False)**

    Answer: True.

    Explanation: This is one of the differences between creating Copilot Chat agents and SharePoint agents.

30. You can enter a Welcome message in a SharePoint agent. **(True/False)**

    Answer: True.

    Explanation: A Welcome message isn't available in Copilot Chat agents.

31. SharePoint agents support a maximum of three starter prompts. **(True/False)**

    Answer: True.

    Explanation: Copilot Chat agents can have an unlimited number of starter prompts.

32. The Copilot tool in SharePoint doesn't carry on a conversation with you to refine instructions like Copilot Studio does in Copilot Chat. **(True/False)**

    Answer: True.

    Explanation: In SharePoint, you refine the instructions manually without interactive prompts from the tool.

33. The Code Interpreter and the Image Generator features aren't available in the Copilot tool in SharePoint. **(True/False)**

    Answer: True.

    Explanation: These features aren't available because the primary focus of SharePoint agents is to enhance content discovery, streamline workflows, and provide insights based on the content within SharePoint sites.

34. Once you're done making your final changes to the SharePoint agent, you select the Create button to save your changes. **(True/False)**

    Answer: True.

    Explanation: If the agent was in draft mode, then saving it converts it to a live agent.

35. Both Copilot Studio and the Copilot agent tool in SharePoint provide a test feature that allows you to test the agent either while it's in draft mode or after it went live. **(True/False)**

    Answer: True.

    Explanation: Testing an agent is covered in greater detail in the next training unit.

6.4

Test and edit your agents

Abbreviation	Full Form
MB	Megabyte

1. Testing an agent is crucial for ensuring its effectiveness and reliability. **(True/False)**

   Answer: True.

   Explanation: By conducting thorough tests, you can identify and address any issues or bugs in the agent's behavior before real-world interactions.

2. Once you finish configuring an agent, Microsoft recommends that you test the agent before you create it. **(True/False)**

   Answer: True.

   Explanation: Testing helps identify issues early, refine instructions, improve user experience, optimize performance, gather feedback for iteration, and ensure compliance.

3. Testing allows you to identify and address any issues or bugs in the agent's behavior before it goes live. **(True/False)**

   Answer: True.

   Explanation: Doing so helps ensure the agent functions as expected and provides accurate responses.

4. By testing the agent, you can refine and improve the instructions and responses. **(True/False)**

   Answer: True.

   Explanation: This ensures the agent's behavior aligns with your expectations and meets the needs of your users.

5. Testing provides an opportunity to experience the agent from the end user's perspective. **(True/False)**

   Answer: True.

   Explanation: This helps you understand how users interact with the agent so that you can make any necessary adjustments to enhance the user experience.

6. Testing allows you to evaluate the agent's performance, including response times and accuracy. **(True/False)**

   Answer: True.

   Explanation: You can make optimizations to improve the agent's efficiency and effectiveness.

7. Testing provides valuable feedback that can be used to iterate and improve the agent. **(True/False)**

   Answer: True.

   Explanation: This iterative process helps create a more robust and reliable agent.

8. Testing helps ensure that the agent complies with any relevant policies, regulations, or guidelines. **(True/False)**

   Answer: True.

   Explanation: Compliance testing is important for agents that handle sensitive information or perform critical tasks.

9. Once an agent is created in either SharePoint or Copilot Chat, you should still periodically test it. **(True/False)**

   Answer: True.

   Explanation: Periodic testing helps you analyze the agent's continual effectiveness and whether it still reflects your goals.

10. Post-deployment testing is equally important to ensure the agent's ongoing performance, reliability, and user satisfaction. **(True/False)**

    Answer: True.

    Explanation: Continuous monitoring and feedback help maintain and improve the agent over time.

11. You should test the agent's tones and styles by modifying the instructions. **(True/False)**

    Answer: True.

    Explanation: For example, instruct the agent to respond like a kind, patient teacher or in the style of a friendly customer service representative, or try a professional, corporate voice or a friendly, casual tone.

12. You should ensure that the instructions provided to the agent are clear and accurate. **(True/False)**

    Answer: True.

    Explanation: Test the agent's responses to see if it follows the instructions correctly, such as providing step-by-step guidance when asked how to create a new ticketing system in Microsoft 365 Copilot Chat.

13. Test the agent's responses to ensure consistency in following the instructions by asking similar questions in different ways. **(True/False)**

    Answer: True.

    Explanation: For example, ask how to set permissions for a document library in a SharePoint site and how to manage permissions for a library in SharePoint.

14. You can test new instructions with questions such as how to manage permissions in SharePoint. **(True/False)**

    Answer: True.

    Explanation: Compare the differences in the agent's replies based on the tone you set.

15. Test the agent's adaptability by modifying the instructions and observing how quickly and effectively it adapts to the changes. **(True/False)**

    Answer: True.

    Explanation: For instance, change the instructions to provide brief summaries instead of detailed steps and ask how to create a new ticketing system in Copilot Chat.

16. Test the agent's ability to handle edge cases or unusual instructions. **(True/False)**

    Answer: True.

    Explanation: For example, instruct the agent to provide troubleshooting steps for error code 0x80070005.

17. Gather user feedback on the clarity and helpfulness of the instructions. **(True/False)**

    Answer: True.

    Explanation: Ask users if the instructions provided by the agent are easy to understand and follow, then use this feedback to refine and improve the instructions.

18. Verify knowledge base integration by asking questions that should be answered using the knowledge base. **(True/False)**

    Answer: True.

    Explanation: For example, ask what the company policy on remote work is.

19. Regularly update the knowledge base with new information and test the agent's responses. **(True/False)**

    Answer: True.

    Explanation: For instance, after adding a new policy, ask what the new policy on vacation days is.

20. Test the agent's ability to cross-reference information from different sources. **(True/False)**

    Answer: True.

    Explanation: For example, ask to explain the process for submitting an expense report and the related approval workflow.

21. When a SharePoint hub site is included as the source for the agent, it automatically includes its associated sites. **(True/False)**

    Answer: True.

    Explanation: The agent uses information from both the hub site and its associated sites to respond, so verify that the agent includes information from both.

22. Test the Code interpreter by providing various natural language instructions and evaluating the results. **(True/False)**

    Answer: True.

    Explanation: For example, ask the agent to generate a bar chart using a provided data set.

23. Test the Code interpreter with more complex natural language queries. **(True/False)**

    Answer: True.

    Explanation: For example, ask the agent to analyze a data set and provide a summary of the key findings.

24. Test the Code interpreter's ability to handle edge cases. **(True/False)**

    Answer: True.

    Explanation: For example, ask the agent to create a scatter plot with a trend line using a provided data set.

25. Gather user feedback on the clarity and effectiveness of the Code interpreter. **(True/False)**

    Answer: True.

    Explanation: Ask users if the results from the generated code reflect their natural language instruction and use this feedback to refine the capabilities.

26. Test the Image generator by providing detailed prompts and evaluating the generated images. **(True/False)**

    Answer: True.

    Explanation: For example, ask the agent to generate an image of a sunset over a mountain range.

27. Test the Image generator with complex queries. **(True/False)**

    Answer: True.

    Explanation: For example, ask the agent to create a scatter plot of specific data points, include a trend line, and provide the R code used to generate the plot.

28. Evaluate default starter prompts to ensure they're engaging and informative. **(True/False)**

    Answer: True.

    Explanation: For example, test responses to prompts such as what can you do or how can you help me today.

29. Customize the starter prompts to better suit your audience and test the agent's responses. **(True/False)**

    Answer: True.

    Explanation: For instance, test a prompt such as how can I get started with using SharePoint for project management.

30. Observe how users interact with the starter prompts and gather feedback to refine them. **(True/False)**

    Answer: True.

    Explanation: Ask users if the prompts are helpful and if they have suggestions for improvement.

31. When you edit an agent in SharePoint or Copilot Chat, you use the same tool to edit the agent as you did to create it. **(True/False)**

    Answer: True.

    Explanation: For a Copilot Chat agent, you use Copilot Studio. For a SharePoint agent, you use the Copilot agent tool embedded within SharePoint.

32. When you edit an agent, shared users of that agent can't see the latest changes until the agent is reshared with them. **(True/False)**

    Answer: True.

    Explanation: Once you update an agent, your changes can sometimes take several minutes to become available for end users.

33. When an agent has SharePoint files or folders as knowledge sources and the agent is shared with specific users in the organization, Microsoft recommends that you reshare the agent with the same group of users. **(True/False)**

    Answer: True.

    Explanation: Resharing automatically shares the files and folders again with the users to ensure consistent agent experience.

34. To edit a Copilot Chat agent, sign in to Microsoft 365 Copilot with your work or school account. **(True/False)**

    Answer: True.

    Explanation: The Microsoft Copilot Chat page appears by default.

35. If the agent appears in the list of pinned and unpinned agents, hover over the agent and select the ellipsis (More) icon, then select Edit from the drop-down menu. **(True/False)**

    Answer: True.

    Explanation: This opens Copilot Studio with the agent's information displayed on the Configure tab.

36. If the agent does not appear in the list of pinned and unpinned agents, select All agents in the navigation pane to open the Agent Store. **(True/False)**

    Answer: True.

    Explanation: In the list of Your Agents, select the ellipsis icon for that agent and then select Edit from the drop-down menu.

37. After making necessary changes to a Copilot Chat agent and testing them if necessary, select the Update button. **(True/False)**

    Answer: True.

    Explanation: This finalizes the edits to the agent.

38. Every time you create an agent in SharePoint, it's stored as a .agent file. **(True/False)**

    Answer: True.

    Explanation: If created from the homepage of a site, the agent file is automatically stored under Site contents > Site Assets > Copilots. If created from other places, it's automatically saved to the current document library folder.

39. To edit a SharePoint agent, locate the .agent file, select it, and then choose Edit. **(True/False)**

    Answer: True.

    Explanation: This opens the Copilot tool in SharePoint that you used to create the agent. Make your necessary changes and then save the agent.

40. You can't edit a SharePoint site's ready-made agent that's automatically created by Copilot when the user creates the site. **(True/False)**

    Answer: True.

    Explanation: The ready-made agent cannot be edited.

6.5

Manage user access and permissions for agents

Abbreviation	Full Form
MFA	Multifactor Authentication
RBAC	Role-based Access Control

1. Having access to Copilot Chat doesn't automatically grant rights to build, publish, or manage agents. **(True/False)**

   Answer: True.

   Explanation: Agent creation and management require distinct Copilot Studio licensing and the correct environment role in Power Platform.

2. Declarative or public web-grounded agents can appear in the Microsoft 365 Agent store based on your store settings. **(True/False)**

   Answer: True.

   Explanation: Copilot Chat users can interact with these agents according to the store and tenant configurations, often without any extra licenses or fees.

3. Tenant-specific or Copilot Studio agents typically require extra licensing, Copilot Studio user licenses, or an Azure subscription. **(True/False)**

   Answer: True.

   Explanation: These agents may use pay-as-you-go or message pack consumption and are governed by separate Copilot Studio licensing and capacity rules.

4. Eligible Microsoft 365 subscribers have access to the Copilot Chat experience at no extra cost. **(True/False)**

   Answer: True.

   Explanation: This includes users with an Exchange Online mailbox and a Microsoft Entra ID account who can open Copilot in Teams or the web app and interact with chat-based assistance as well as many public or declarative agents.

5. To build, customize, or publish tenant-specific agents, users need Copilot Studio licensing. **(True/False)**

   Answer: True.

   Explanation: These licenses allow creation, testing, and publishing inside the tenant.

6. Pay-as-you-go or consumption-based agents may lead to extra costs when agents go beyond what is included by default. **(True/False)**

   Answer: True.

   Explanation: The tenant must have capacity configured through the Power Platform admin center for users to publish and run these agents.

7. The three simple buckets for Copilot access are Free, Licensed, and Consumption-billed. **(True/False)**

   Answer: True.

   Explanation: Free covers Copilot Chat plus many public or declarative agents, Licensed covers tenant-specific or customized agents created in Copilot Studio, and Consumption-billed covers high-volume or premium agents that require message packs or pay-as-you-go.

8. Configuring user access to agents is the process of granting or restricting the ability for individuals or groups to interact with agents in your environment. **(True/False)**

   Answer: True.

   Explanation: Access defines what data an agent can touch and who can request actions from it, ensuring the right balance between productivity and security.

9. To enable a user to create and manage Copilot agents, you must assign them a Copilot Studio user license through the Microsoft 365 admin center. **(True/False)**

   Answer: True.

   Explanation: Without this license, the user can't access Copilot Studio to build or manage agents.

10. Assigning a Copilot license in the Microsoft 365 admin center affects the user's entitlement across the entire tenant. **(True/False)**

    Answer: True.

    Explanation: It grants the user the right to use Copilot services across supported apps and, depending on the license, agent experiences in Copilot Studio.

11. Assigning an environment role in the Power Platform admin center determines what level of control the user has inside that specific environment. **(True/False)**

    Answer: True.

    Explanation: Environment roles control whether users can create, edit, manage, or publish agents, while Basic User allows only interaction with shared agents.

12. A Power Platform environment is a container for apps, data, and resources within Microsoft Power Platform. **(True/False)**

    Answer: True.

    Explanation: It acts as a workspace where you can build, manage, and run apps, flows, and agents while keeping them organized and separated from other teams or business units.

13. Every agent you build in Copilot Studio is associated with a specific Power Platform environment. **(True/False)**

    Answer: True.

    Explanation: The agent's environment contains its configuration, data connections, and any linked resources.

14. Environment Maker role allows users to create and edit agents in that environment. **(True/False)**

    Answer: True.

    Explanation: Environment Admin provides full control over the environment, including agents, while Basic User allows only interaction with shared agents.

15. Users in one environment can't access agents in another environment unless they're explicitly given permissions. **(True/False)**

    Answer: True.

    Explanation: This separation prevents accidental changes and ensures sensitive data stays protected.

16. Users need both a Copilot license and the appropriate environment role to create, edit, or publish agents. **(True/False)**

    Answer: True.

    Explanation: A user with only a Copilot license can use a tenant agent but can't create or publish new agents without the Environment Maker role.

17. Administrators can use security groups in Microsoft Entra ID to assign environment roles to multiple users at once. **(True/False)**

    Answer: True.

    Explanation: When you assign a role to a group, every member of that group automatically inherits the same permissions.

18. Group-based role assignments provide simplified management, consistency, and scalability. **(True/False)**

    Answer: True.

    Explanation: Adding a new employee to a group immediately grants them the correct access without manually updating permissions for each user.

19. Use the principle of least privilege when managing agent access. **(True/False)**

    Answer: True.

    Explanation: Always assign the lowest level of permissions a user needs to perform their role, such as giving most employees only Basic User access.

20. Keep experimental agents and testing in a non-production environment. **(True/False)**

    Answer: True.

    Explanation: This reduces the risk of unfinished or faulty agents disrupting real business processes.

21. Regularly review access by auditing group memberships, licenses, and environment roles on a scheduled basis. **(True/False)**

    Answer: True.

    Explanation: Roles and responsibilities change over time, so remove access that is no longer required.

22. Use reports in the Power Platform admin center and Microsoft 365 audit logs to monitor agent usage. **(True/False)**

    Answer: True.

    Explanation: Monitoring helps identify unusual patterns or potential misuse.

23. For high-value agents or environments that handle sensitive data, combine with conditional access policies such as requiring MFA. **(True/False)**

    Answer: True.

    Explanation: This strengthens security when managing agent access.

24. To assign a Copilot license, sign into the Microsoft 365 admin center, navigate to Users > Active users, select the user, go to Licenses and apps, and select the checkbox for the Copilot product license. **(True/False)**

    Answer: True.

    Explanation: Save the changes to grant the baseline license required for agent access.

25. To configure environment roles, sign into the Power Platform admin center, select the environment, go to Settings > Users + permissions > Users, and assign the appropriate role such as Basic User or Environment Maker. **(True/False)**

    Answer: True.

    Explanation: This fine-tunes permissions for the specific environment where the agent resides.

26. Users of published agents don't need a Copilot Studio license or environment role. **(True/False)**

    Answer: True.

    Explanation: They can interact with agents as long as they have access to the published endpoint such as Teams or SharePoint.

27. Admins can manage agent availability, assign agents to users or groups, and block or remove agents using the Copilot Control System in the Microsoft 365 admin center. **(True/False)**

    Answer: True.

    Explanation: The Copilot Control System is the centralized interface for managing Copilot agents, configuring scenarios, assigning licenses, and enforcing policies.

28. Even if a user has a Copilot license, they can't use the agent unless they're assigned the correct environment role. **(True/False)**

    Answer: True.

    Explanation: Power Platform environment roles are critical for controlling access to data and functionality.

29. Scenario: A marketing employee has a standard Microsoft 365 Business subscription. Can this user interact with a publicly available FAQ Assistant agent without any extra license?

    Answer: Yes.

    Explanation: Eligible Microsoft 365 subscribers can use many public or declarative agents that rely on instructions and public web content at no extra cost.

30. Scenario: An HR power user wants to update and republish the Recruiting Assistant agent in Copilot Studio. What is required?

    Answer: Copilot Studio license and Environment Maker role in the relevant Power Platform environment.

    Explanation: Only users with the proper Copilot Studio license and environment role can go into Copilot Studio to update or republish tenant-specific agents.

31. Scenario: A user can open Copilot Chat but cannot open Copilot Studio or publish tenant-scoped agents. What is most likely missing?

    Answer: Copilot Studio user license.

    Explanation: Without the proper Copilot Studio license, a user might be able to use Copilot Chat but can't open Copilot Studio or publish tenant-scoped agents.

6.6

Examine agent approval and governance

Abbreviation	Full Form
GDPR	General Data Protection Regulation
HIPAA	Health Insurance Portability and Accountability Act
MIP	Microsoft Information Protection

1. Agent approval and governance represent an ongoing cycle where admins and stakeholders evaluate requests, monitor usage, and enforce standards. **(True/False)**

   Answer: True.

   Explanation: Each decision whether to approve, reject, or modify an agent can affect not just a single department but potentially the entire organization.

2. Governance isn't about blocking users but about enabling them to innovate responsibly. **(True/False)**

   Answer: True.

   Explanation: Properly implemented approval workflows, clear policies, and regular oversight allow end users to take advantage of Copilot's capabilities while ensuring that administrators maintain visibility and control.

3. Administrators can manage several types of agents in Microsoft 365 Copilot. **(True/False)**

   Answer: True.

   Explanation: These include custom agents, shared agents, first-party agents, external agents, and frontier agents.

4. Custom agents are built with predefined instructions and actions and follow structured logic for predictable, rule-based tasks. **(True/False)**

   Answer: True.

   Explanation: Before custom agents are available to users, they go through an admin approval and publishing process to ensure compliance and readiness.

5. Shared agents are configured for use by multiple users or groups. **(True/False)**

   Answer: True.

   Explanation: Creators share these agents with other users.

6. First-party agents are developed by Microsoft and integrated with Microsoft 365 services. **(True/False)**

   Answer: True.

   Explanation: These prebuilt agents include Researcher, Analyst, Writing Coach, and so on.

7. Frontier agents are experimental or advanced agents that use new capabilities or integrations and might require more oversight or limited rollout. **(True/False)**

   Answer: True.

   Explanation: These agents might be in early stages of development or testing.

8. The approval process for Copilot agents provides the structure needed to decide which agents are allowed to operate in your Microsoft 365 environment. **(True/False)**

   Answer: True.

   Explanation: Without an approval process, any agent could be introduced within your organization, potentially creating risks with data access or operational disruption.

9. The administrator roles that can manage agents in the Microsoft 365 admin center are AI Administrator and Global Reader. **(True/False)**

   Answer: True.

   Explanation: Global Reader is view-only with no edit capability. Use roles with the fewest permissions to improve security.

10. A typical approval process has three stages: Submission, Review, and Decision. **(True/False)**

    Answer: True.

    Explanation: Submission involves a user or developer requesting approval with details on the agent's purpose, intended audience, and required permissions. Review assesses technical and organizational factors. Decision involves approving, rejecting, or sending back for revisions.

11. To view pending agent requests, sign in to the Microsoft 365 admin center, select Copilot > Agents, and then select the Requested agents tab. **(True/False)**

    Answer: True.

    Explanation: Each submission request displays details such as the agent name, description, and requested data connections.

12. Selecting a request in the Requested agents tab opens the review pane. **(True/False)**

    Answer: True.

    Explanation: It displays an overview of what the agent is designed to do, along with its data access requirements, where technical vetting begins.

13. Administrators act as gatekeepers in the approval process. **(True/False)**

    Answer: True.

    Explanation: They manage the approval interface, enforce governance policies, and confirm technical details such as API access, permissions, and compliance alignment.

14. Business owners bring context to the approval process. **(True/False)**

    Answer: True.

    Explanation: For example, they can clarify why an agent pulling data from Dynamics 365 supports Sales operations.

15. Security and compliance officers help minimize risks by spotting agents that request broad access to sensitive data without sufficient justification. **(True/False)**

    Answer: True.

    Explanation: Administrators must often consult with these groups before making a final decision.

16. Microsoft 365 supports adding stakeholders into the review process when reviewing an agent in the admin center. **(True/False)**

    Answer: True.

    Explanation: This ensures the right people are consulted before the request moves forward.

17. Documenting every decision, for example using a SharePoint list to record agent requests, reviewers, and decisions, helps with transparency. **(True/False)**

    Answer: True.

    Explanation: It also provides a reference if questions arise later.

18. Approving an agent isn't the end of the story because agents evolve with new features, bug fixes, or expanded functionality. **(True/False)**

    Answer: True.

    Explanation: Without careful version control, an updated agent could introduce risks that weren't present during the initial approval process.

19. To view detailed information on an agent, select the Agent inventory tab on the Agents page and then select the agent to open the agent's detail pane. **(True/False)**

    Answer: True.

    Explanation: The detail pane displays an overview including description, deployment status, version history, user availability, publisher, agent type, capabilities, knowledge sources, actions, and security and compliance certification such as Publisher attested or Microsoft 365 certified.

20. Availability options for an agent include No users in the organization can install and use this app, All users in the organization can install and use this app, or Only selected users in the organization can install and use this app. **(True/False)**

    Answer: True.

    Explanation: When an update is available, admins can review and approve it before deployment to prevent automatic upgrades that might bypass governance checks.

21. Administrators should maintain rollback strategies in case an updated agent causes issues. **(True/False)**

    Answer: True.

    Explanation: Reverting to the previous version minimizes disruptions and ensures users can continue working without extended downtime.

22. Governance policies define the guardrails for how agents can be developed, approved, and deployed in your environment. **(True/False)**

    Answer: True.

    Explanation: A strong governance policy addresses data access boundaries, approval workflows, and usage monitoring.

23. The Copilot Control System within the Microsoft 365 admin center is the central hub for Copilot agent governance. **(True/False)**

    Answer: True.

    Explanation: Here administrators can block or allow agents, assign agents to specific users or groups, control agent extensibility, configure agent usage settings, and manage billing policies.

24. For agents built in Copilot Studio, the Copilot governance page in the Microsoft Power Platform admin center provides a central administration page. **(True/False)**

    Answer: True.

    Explanation: It empowers admins with guidelines, visibility, and controls to manage copilots and Copilot agents' adoption at scale.

25. Data policies in Power Platform allow IT administrators to permit or restrict the use of specific Power Platform connectors. **(True/False)**

    Answer: True.

    Explanation: This prevents the use of unauthorized data sources.

26. Data policies also enable blocking Anonymous Access, blocking Publish, and preventing makers from publishing to specific channels or before certifying the solution by IT. **(True/False)**

    Answer: True.

    Explanation: Sharing limits prevent makers from sharing non-certified solutions too broadly until reviewed and certified.

27. Environment rules, groups, and routing allow creation of environment groups, definition of environment-specific rules, and routing makers to personal development environments. **(True/False)**

    Answer: True.

    Explanation: This supports an advanced environment strategy for building copilots and agents.

28. Maker onboarding provides a custom welcome message with step-by-step guidance and resources, including company-specific content that can replace the default first-time help experience. **(True/False)**

    Answer: True.

    Explanation: This helps new makers and developers get started with building and managing copilot applications.

29. Advisor offers out-of-the-box recommendations and best practices by continuously scanning the environment and identifying copilots and agents that need IT attention. **(True/False)**

    Answer: True.

    Explanation: Administrators receive regular recommendations on gaps to address along with clear actions.

30. Catalog provides a centralized repository for certified custom connectors, official organizational templates, and other reusable controls. **(True/False)**

    Answer: True.

    Explanation: This simplifies creation of complex solutions while promoting reusability and adherence to company guidelines.

31. Microsoft Information Protection labels can be integrated with Copilot Studio to force copilot content to get tagged based on the MIP labels of Microsoft 365 content. **(True/False)**

    Answer: True.

    Explanation: This ensures sensitive data is properly labeled and managed according to organizational policies.

32. Copilot audit logging to Microsoft Purview captures user commands, responses generated by Copilot, and administrative actions. **(True/False)**

    Answer: True.

    Explanation: These logs are stored in the Microsoft Purview portal for auditing and compliance checks.

33. The Copilot Security checker performs security assessments that can warn makers before they publish a copilot. **(True/False)**

    Answer: True.

    Explanation: Each copilot is designed to be secure by default, but settings can be adjusted with potential risks.

34. The Security page in the Power Platform admin center provides a consolidated experience for managing security for Power Platform workloads including Copilots and Copilot agents at enterprise scale. **(True/False)**

    Answer: True.

    Explanation: Security and compliance sit at the heart of agent governance.

35. Agents should use secure authentication methods such as OAuth. **(True/False)**

    Answer: True.

    Explanation: This ensures they aren't bypassing access controls.

36. Agents should follow the principle of least privilege by requesting only the permissions they need. **(True/False)**

    Answer: True.

    Explanation: For example, an HR agent that only needs employee names shouldn't request access to salary information.

37. Every agent action should be logged for review. **(True/False)**

    Answer: True.

    Explanation: Audit logging allows admins to review what data was accessed and when.

38. To monitor agent compliance, go to the Microsoft Purview portal, select Solutions > Audit, and search for Copilot-related events using keywords. **(True/False)**

    Answer: True.

    Explanation: Review the logs to verify that agent activities align with your organization's policies and don't expose sensitive data.

39. Schedule periodic compliance reviews, for example once every quarter, to audit all active agents, their permissions, and usage patterns. **(True/False)**

    Answer: True.

    Explanation: This ensures that even after approval, agents continue to operate within acceptable security and compliance boundaries.

6.7

Monitor and manage the agent lifecycle

Abbreviation	Full Form
API	Application Programming Interface

1. The lifecycle of a Copilot agent doesn't end once it's been approved and deployed. **(True/False)**

   Answer: True.

   Explanation: Deployment marks the beginning of a continuous management process where administrators must monitor performance, evaluate effectiveness, and ensure the agent continues to meet business and compliance requirements.

2. Without consistent monitoring and lifecycle management, agents can drift from their intended purpose, consume unnecessary resources, or create security risks. **(True/False)**

   Answer: True.

   Explanation: Proactive monitoring helps catch small problems before they escalate into larger ones.

3. Retirement is as important as creation in the agent lifecycle. **(True/False)**

   Answer: True.

   Explanation: Every agent eventually reaches retirement, whether replaced by a newer version, rendered obsolete by process changes, or no longer supported.

4. Monitoring usage and performance ensures that agents continue to deliver value without causing unintended disruptions. **(True/False)**

   Answer: True.

   Explanation: Admins must know how frequently an agent is being used, who is using it, and whether it's performing efficiently.

5. User adoption levels help identify whether an agent design problem, usability issues, or poor communication exists. **(True/False)**

   Answer: True.

   Explanation: For example, low adoption of an agent deployed to streamline HR requests might indicate these issues.

6. Performance metrics include how quickly an agent responds to queries, whether it delivers accurate results, and how often errors occur. **(True/False)**

   Answer: True.

   Explanation: For example, if a finance agent takes 30 seconds to return data from a ledger system, the delay could disrupt workflows.

7. Error tracking provides insights into whether an agent is misconfigured or struggling to connect to backend systems. **(True/False)**

   Answer: True.

   Explanation: Monitoring failed requests is part of error tracking.

8. To monitor usage in Microsoft 365, sign in to the Microsoft 365 admin center, select Reports > Usage, then under Microsoft 365 Copilot > Copilot, select the Agents tab. **(True/False)**

   Answer: True.

   Explanation: Use filters such as date range, department, or user group to narrow analysis, and export data to Excel for deeper analysis.

9. Operational insights in the Microsoft 365 admin center help identify permission usage, cross-service dependencies, and usage trends. **(True/False)**

   Answer: True.

   Explanation: For example, if an agent only retrieves files without making changes, it might prompt scaling back permissions to read-only.

10. To access operational insights, go to Reports > Copilot in the Microsoft 365 admin center and review the Usage and Agents tabs under Copilot usage reports. **(True/False)**

    Answer: True.

    Explanation: Under Agents usage reports, review information for permissions in use, connected services, and usage trends.

11. Every agent passes through the stages of creation, approval, deployment, maintenance, and retirement. **(True/False)**

    Answer: True.

    Explanation: Treating lifecycle management as a structured process helps maintain order when multiple agents are deployed simultaneously.

12. Blocking an agent prevents any users in the tenant from accessing the agent. **(True/False)**

    Answer: True.

    Explanation: This action removes clutter from the environment and ensures users aren't relying on outdated tools.

13. Removal of an agent from the inventory applies to first-party or external agents. **(True/False)**

    Answer: True.

    Explanation: You can add the agent back into inventory by acquiring it from the store.

14. To block or remove an agent, navigate to Copilot > Agents in the Microsoft 365 admin center, select the agent, and in the detail pane choose Remove or Block. **(True/False)**

    Answer: True.

    Explanation: Decide whether to block or remove for everyone or specific users or groups, then confirm and save.

15. Communicate retirement plans to users at least 30 days in advance. **(True/False)**

    Answer: True.

    Explanation: Provide training or documentation on the replacement agent to ensure business continuity.

16. Dashboards provide a single view of the health, performance, and adoption of agents across the organization. **(True/False)**

    Answer: True.

    Explanation: The Microsoft 365 admin center offers Copilot-specific dashboards, while the Power Platform admin center is useful for agents built or extended using Power Platform tools.

17. Dashboards commonly display usage summaries, error and health indicators, and top agents. **(True/False)**

    Answer: True.

    Explanation: Usage summaries show how often agents are used broken down by department or user role, while top agents help identify which solutions deliver value.

18. People who can see the reports include Global admins, Exchange admins, SharePoint admins, Skype for Business admins, Global reader, Usage Summary Reports reader, Reports reader, Teams Administrator, Teams Communications Administrator, and User Experience Success Manager. **(True/False)**

    Answer: True.

    Explanation: Microsoft recommends using roles with the fewest permissions to improve security.

19. To access dashboards in Microsoft 365, go to Reports > Usage, then under the Reports section select Microsoft 365 Copilot. **(True/False)**

    Answer: True.

    Explanation: View the various reporting dashboards that are available.

20. In the Power Platform admin center, select Copilot > Copilot Studio, then scroll to the Agents section and select an agent to see detailed performance data. **(True/False)**

    Answer: True.

    Explanation: This includes average response time, abandonment rates, and escalation frequency.

21. Common troubleshooting issues include connectivity problems, permission errors, and performance degradation. **(True/False)**

    Answer: True.

    Explanation: Connectivity problems may occur if an agent loses connection to a backend service. Permission errors arise from insufficient permissions. Performance degradation can result from high load or dependency bottlenecks.

22. To troubleshoot a procurement agent failing to pull purchase order data, check the service health dashboard for Dynamics 365, review the agent's permission set, and examine logs for failed API calls. **(True/False)**

    Answer: True.

    Explanation: Resolve by renewing permissions or reconfiguring the connection.

23. Scenario: An HR agent deployed to streamline requests shows low adoption. What might this indicate?

    Answer: Poor communication to employees, usability issues, or an agent design problem.

    Explanation: Low user adoption levels can indicate these issues.

24. Scenario: A finance agent takes 30 seconds to return data from a ledger system. What should admins investigate?

    Answer: Performance metrics and potential workflow disruptions.

    Explanation: The delay could disrupt workflows, so admins should track response times and error frequency.

25. Scenario: You notice a customer support agent heavily uses Teams integration but rarely connects to SharePoint. What does this suggest?

    Answer: The data source strategy might need adjustment to better align with intended use.

    Explanation: Operational insights highlight cross-service dependencies and can prompt review of the data source strategy.

26. Scenario: An agent update requests full CRM access when it previously only pulled customer contact information. What should the admin do?

    Answer: Re-evaluate whether the change is acceptable before approving the update.

    Explanation: Admins must review updates to prevent risks that weren't present during initial approval.
